CLAUD. EPITH.

THE FOURTH EDITION.

DUBLIN:
PRINTED BY J. MOORE, NO. 45, COLLEGE-GREEN.
1796.
THE general design of the following sheets is to inlift Imagination under the banner of Science, and to lead her votaries form the looser analogies, which dres out the imagery of poetry, to the stricter ones, which from the ratiocination of philosophy. While their particular design is to induce the ingenious to cultivate the knowledge of BOTANY; by introducing them to the vestibule of that delightful science, and recommending to their attention the immortal works of the Swedish Naturalist LINNEUS.

In the first Poem, or Economy of Vegetation, the physiology of Plants is delivered; and the operation of the Elements, as far as they may be supposed to affect the growth of Vegetables.
vi  

ADVERTISEMENT.

In the second poem, or Loves of the Plants, which is here presented to the Reader, the Sexual System of Linneus is explained, with the remarkable properties of many particular plants.

The author has withheld this work (excepting a few pages) many years from the press, according to the rule of Horace, hoping to have rendered it more worthy the acceptance of the public,—but finds at length, that he is less able, from diffuse, to correct the poetry; and, from want of leisure, to amplify the annotations.
LINNEUS has divided the vegetable world into 24 Classes; these Classes into about 120 Orders; these Orders contain about 2000 Families, or Genera; and these Families about 20,000 Species; besides the innumerable Varieties, which the accidents of climate or cultivation have added to these Species.

The Classes are distinguished from each other in this ingenious system, by the number, situation, adhesion, or reciprocal proportion of the males in each flower. The Orders, in many of these Classes, are distinguished by the number, or other circumstances of the females. The Families, or Genera, are characterized by the analogy of all the parts of the flower or fructification. The Species are distinguished by the foliage of the plant; and the Varieties by any accidental circumstance of colour, taste, or odour; the seeds of these do not always pro-
duce plants similar to the parent; as in our numerous fruit-trees and garden flowers; which are propagated by grafts or layers.

The first eleven Classes include the plants, in whose flowers both the sexes reside; and in which the Males or Stamens are neither united, nor unequal in height when at maturity; and are therefore distinguished from each other simply by the number of males in each flower, as is seen in the annexed Plate, copied from the Dictionaire Botanique of M. Bulliard, in which the numbers of each division refer to the Botanic Classes.

CLASS I. **One Male**, *Monandria*; includes the plants which possess but One Stamen in each flower.

II. **Two Males**, *Diandria*. Two Stamens.

IV. **Four Males**, *Tetrandria*. Four Stamens.

V. **Five Males**, *Pentandria*. Five Stamens.

VI. **Six Males**, *Hexandria*. Six Stamens.

VII. **Seven Males**, *Heptandria*. Seven Stamens.

VIII. **Eight Males**, *Octandria*. Eight Stamens.
IX. NINE MALES, Enneandria. Nine Stamens.

X. TEN MALES, Decandria. Ten Stamens.

XI. TWELVE MALES, Dodecandria. Twelve Stamens.

The next two Classes are distinguished not only by the number of equal and disunited males, as in the above eleven Classes, but require an additional circumstance to be attended to, viz. whether the males or stamens be situated on the calyx, or not.

XII. TWENTY MALES, Icosandria. Twenty Stamens inserted on the calyx or flower-cup; as is well seen in the last Figure of No. xii. in the annexed Plate.

XIII. MANY MALES, Polyandria. From 20 to 100 Stamens, which do not adhere to the calyx; as is well seen in the first Figure of No. xiii. in the annexed Plate.

In the next two Classes, not only the number of stamens are to be observed, but the reciprocal proportions in respect to height.

XIV. TWO POWERS, Didynamia. Four Stamens, of which two are lower than the other two; as is seen in the two first Figures of No. xiv.

XV. FOUR POWERS, Tetrodynamia. Six Stamens, of which four are taller, and the two
lower ones opposite to each other; as is seen in the third Figure of the upper row in No. 15.

The five subsequent Classes are distinguished not by the number of the males, or stamens, but by their union or adhesion, either by their anthers, or filaments, or to the female or pistil.

XVI. One Brotherhood, Monadelphia. Many Stamens united by their filaments into one company; as in the second Figure below of No. xvi.

XVII. Two Brotherhoods, Diadelphia. Many Stamens united by their filaments into two companies; as in the uppermost Fig. No. xvii.

XVIII. Many Brotherhoods, Polyadelphia. Many Stamens united by their filaments into three or more companies, as in No. xviii.

XIX. Confederare Males, Syngenesia. Many Stamens united by their anthers; as in the first and second Figures, No. xix.

XX. Feminine Males, Gynandria. Many Stamens attached to the pistil.

The next three Classes consist of plants, whose flowers contain but one of the sexes; or if some of them contain both sexes, there are other flowers accompanying them of but one sex.
XXI. **ONE HOUSE, Monœcia.** Male flowers and female flowers separate, but on the same plant.

XXII. **Two HOUSES, Dicœcia.** Male flowers and female flowers separate, on different plants.

XXIII. **POLYGAMY, Polygœmia.** Male and female flowers on one or more plants, which have at the same time flowers of both sexes.

The last Class contains the plants whose flowers are not discernible.

XXIV. **CLANDESTINE MARRIAGE. Cryptogœmia.**

The Orders of the first thirteen Classes are founded on the number of Females, or Pistils, and distinguished by the names, **ONE FEMALE, Monogœnia.** **TWO FEMALES, Digœnia.** **THREE FEMALES, Trigœnia,** &c. as is seen in No. i. which represents a plant of one male, one female; and in the first Figure of No. xi. which represents a flower with twelve males, and three females; (for, where the pistils have no apparent stiles, the summits, or stigmas, are to be numbered) and in the first figure of No. xii. which represents a flower with twenty males and many females; and in the last Figure of the same No. which has twenty males and one female; and in No. xiii. which represents a flower with many males and many females.
The classes of Two Powers, is divided into two natural Orders; into such as have their seeds naked at the bottom of the calyx, or flower cup; and such as have their seeds covered; as is seen in No. xiv. Fig. 3. and 5.

The Class of Four Powers, is divided also into two Orders; in one of these the seeds are inclosed in a silicule, as in Shepherd's purse. No. xiv. Fig. 5. In the other they are inclosed in a siliqua, as in Wall-flower. Fig. 4.

In all the other Classes, excepting the Classes Confederate Males, and Clandestine Marriage, as the character of each Class is distinguished by the situations of the males; the character of the Orders is marked by the numbers of them. In the Class One Brotherhood, No. xvi: Fig. 3. the Order of ten males is represented. And in the Class Two Brotherhoods, No. xvii. Fig. 2. the Order ten males is represented.

In the Class Confederate Males, the Orders are chiefly distinguished by the fertility or barrenness of the florets of the disk, or ray of the compound flower.

And in the Class of Clandestine Marriage, the four Orders are termed Ferns, Mosses, Flags, and Fungusses.
The Orders are again divided into Genera, or Families, which are all natural associations, and are described from the general resemblances of the parts of fructification, in respect to their number, form, situation, and reciprocal proportion. These are the Calyx, or Flower-cup, as seen in No. iv. Fig. 1. No. x. Fig. 1. and 3. No. xiv. Fig. 1. 2. 3. 4. Second, the Corol, or Blossom, as seen in No. i. ii. &c. Third, the Males, or Stamens; as in No. iv. Fig. 1. and No. viii. Fig. 1. Fourth, the Females, or Pistils; as in No. i. No. xii. Fig. 1. No. xiv. Fig. 3. No. xv. Fig. 3. Fifth, the Pericarp or Fruit-vessel; as No. xv. Fig. 4. 5. No. xvii. Fig. 2. Sixth, the Seeds.

The illustrious author of the Sexual System of Botany, in his preface to his account of the Natural Orders, ingeniously imagines, that one plant of each Natural Order was created in the beginning; and that the intermarriages of these produced one plant of every Genus, or Family; and that the intermarriages of these Generic, or Family plants, produced all the species; and lastly, that the intermarriages of the individuals of the Species produced the Varieties.
In the following Poem, the name or number of the Class or Order of each plant is printed in Italics; as "Two brother swains." "One House contains them," and the word "secret," expresses the Class of Clandestine Marriage.

The Reader, who wishes to become further acquainted with this delightful field of science, is advised to study the words of the Great Master, and is apprized that they are exactly and literally translated into English, by a Society at Litchfield, in four Volumes Octavo.

To the SYSTEM OF VEGETABLES is prefixed a copious explanation of all the Terms used in Botany, translated from a thesis of Dr. Elmsgreen, with the plates and references from the Philosophia Botannica of Linneus.

To the FAMILIES OF PLANTS is prefixed a Catalogue of the names of plants, and other Botanic Terms, carefully accented, to shew their proper pronunciation; a work of great labour, and which was much wanted, not only by beginners, but by proficients in Botany.
GENTLE READER!

LO, here a CAMERA OBSCURA is presented to thy view, in which are lights and shades dancing on a whited canvas, and magnified into apparent life!—if thou art perfectly at leisure for such trivial amusement, walk in, and view the wonders of my INCHANTED GARDEN.

Whereas P. OVIDIUS NASO, a great Necromancer in the famous Court of AUGUSTUS CAESAR, did by art poetic transmute Men, Women, and even Gods and Goddesses, into Trees and Flowers; I have undertaken by similar art to restore some of them to their original animality, after having remained prisoners so long in their respective vegetable mansions; and
have here exhibited them before thee. Which thou may'st contemplate as diverse little pictures suspended over the chimney of a Lady's dressing-room, connected only by a slight festoon of ribbons. And which, though thou may'st not be acquainted with the originals, may amuse thee by the beauty of their persons, their graceful attitudes, or the brilliancy of their dress.

FAREWELL.
THE

LOVES

OF THE

PLANTS.

CANTO I.

DESCEND, ye hovering Sylphs! aerial Quires,
And sweep with little hands your silver lyres;
With fairy footsteps print your grassy rings,
Ye Gnomes! accordant to the tinkling strings;
While in soft notes I tune to oaten reed
Gay hopes, and amorous sorrows of the mead.

From giant Oaks, that wave their branches dark,
To the dwarf Moss, that clings upon their bark,
What Beaux and Beauties crowd the gaudy groves,
And woo and win their vegetable Loves.

Vegetable Loves. l. 10. Linneus, the celebrated Swedish naturalist, has demonstrated, that all flowers contain families of males or females, or both; and on their marriages has constructed his invaluable system of Botany.
How Snowdrops cold, and blue-eyed Harebells blend
Their tender tears, as o'er the stream they bend;
The lovesick Violet, and the Primrose pale
Bow their sweet heads, and whisper to the gale;
With secret sighs the Virgin Lily droops,
And jealous Cowslips hang their tawny cups.
How the young Rose in beauty's damask pride
Drinks the warm blushes of his bashful bride;
With honey'd lips enamour'd Woodbines meet,
Clasp with fond arms, and mix their kisses sweet.—

Stay thy soft-murmuring waters, gentle Rill;
Hush, whispering Winds, ye rustling Leaves, be still;
Reft, silver Butterflies, your quivering wings;
Alight, ye Beetles, from your airy rings;
Ye painted Moths, your gold-eyed plumage hurl,
Bow your wide horns, your spiral trunks uncurl;
Glitter, ye Glow-worms, on your mossy beds;
Descend, ye Spiders, on your lengthen'd threads;
Slide here, ye horned Snails, with varnish'd shells;
Ye Bee-nymphs, listen in your waxen cells!—

BOTANIC MUSE! who in this latter age
Led by your airy hand the Swedish sage,
Bade his keen eye your secret haunts explore
On dewy dell, high wood, and winding shore;
Say on each leaf how tiny Graces dwell;
How laugh the Pleasures in a blossom's bell;
How infect Loves arife on cobweb wings,
Aim their light shafts, and point their little stings.
"First the tall CANNA lifts his curled brow
Erect to heaven, and plights his nuptial vow; 40
The virtuous pair, in milder regions born,
Dread the rude blast of Autumn's icy morn;
Round the chill fair he folds his crimson vest,
And clasps the timorous beauty to his breast.

Thy love, CALLITRICHE, two Virgins share,
Smit with thy starrv eye and radiant hair;—
On the green margin fits the youth, and laves
His floating train of tresses in the waves;
Sees his fair features paint the streams that pass,
And bends for ever o'er the watery glass.

Two brother swains, of COLLIN's gentle name,
The fame their features, and their forms the same,

Canna. l. 39. Cane, or Indian Reed, One male and one female inhabit each flower. It is brought from between the tropics to our hot-houses, and bears a beautiful crimson flower; the seeds are used as shot by the Indians, and are strung for prayer-beads in some catholic countries.

Callitriche. l. 45. Fine-Hair, Star-graws. One male and two females inhabit each flower. The upper leaves grow in form of a star, whence it is called Stellaria Aquatica by Ray and others; its stems and leaves float far on the water, and are often so matted together, as to bear a person walking on them. The male sometimes lives in a separate flower.

Collinsonia. l. 51. Two males, one female. I have lately observed a very singular circumstance in this flower; the two males stand widely diverging from each other, and the female bends herself into contact first with one of them, and after some time leaves this, and applies herself to the other. It is probable one of the anthers may be mature before the other. See note on Gloriosa and Genista. The females in Nigella, devil in the bush, are very tall compared to the males; and bending over in a circle to them, give the flower some resemblance to a
With rival love for fair Collinia fair
Knit the dark brow, and roll the unsteady eye.
With sweet concern the pitying beauty mourns,
And sooths with smiles the jealous pair by turns.

Sweet blooms Genista in the myrtle shade,
And ten fond brothers woo the haughty maid.

Two knights before thy fragrant altar bend,
Adored Melissa! and two squires attend.

regal crown. The female of the epilobium angustifolium, rose bay willow herb, bends down amongst the males for several days, and becomes upright again when impregnated.

Genista. l. 57. Dyer's broom. Ten males and one female inhabit this flower. The males are generally united at the bottom in two sets, whence Linneus has named the class "two brotherhoods." In the Genista, however, they are united in but one set. The flowers of this class are called papilionaceous, from their resemblance to a butterfly, as the pea-blossom. In the Spartium Scoparium, or common broom, I have lately observed a curious circumstance, the males or flaments are in two sets, one set rising a quarter of an inch above the other; the upper set does not arrive at their maturity so soon as the lower, and the stigma, or head of the female, is produced amongst the upper or immature set; but as soon as the pistil grows tall enough to burst open the keel-leaf, or hood of the flower, it bends itself round in an instant, like a French horn, and infests its head, or stigma, amongst the lower or mature set of males. The pistil, or female, continues to grow in length; and in a few days the stigma arrives again amongst the upper set, by the time they become mature. This wonderful contrivance is readily seen by opening the keel-leaf of the flowers of broom before they burst spontaneously. See note on Collinsonia, Gloriosa, Draba.

Melissa. l. 60. Balm. In each flower there are four males and one female; two of the males stand higher than the other two; whence the name of the class "two powers." I have observed in the Ballota, and others of this class, that the two lower flaments, or males become mature before the two higher. After they have shed their dust, they send themselves away outwards; and the pistil, or female, continuing
MEADIA's soft chains five suppliant beaux confes,
And hand in hand the laughing belle address;
Alike to all, she bows with wanton air,
Rolls her dark eye, and waves her golden hair.

Woo'd with long-care, CURCUMA cold and shy
Meets her fond husband with averted eye:
to grow a little taller, is applied to the upper stamens. See Gloriosa, and Genista.

All the plants of this class, which have naked seeds, are aromatic. The Marum, and Nepeta are particularly delightful to cats; no other brute animals seem pleased with any odours but those of their food or prey.

MEADIA, l. 61. Dodecatheon, American Cowslip, Five males and one female. The males, or anthers, touch each other. The uncommon beauty of this flower accasioned Linneus to give it a name signifying the twelve heathen gods; and Dr. Mead to affix his own name to it. The pistil is much longer than the stamens, hence the flower-stalks have their elegant bend, that the stigma may hang downwards to receive the fecundating dust of the anthers. And the petals are so beautifully turned back to prevent the rain or dew drops from sliding down and washing off this dust prematurely; and at the same time exposing it to the light and air. As soon as the seeds are formed, it erects all the flower-stalks to prevent them from falling out; and thus looses the beauty of its figure. Is this a mechanical effect, or does it indicate a vegetable store to preserve its offspring? See note on Ilex, and Gloriosa.

In the Meadia, the Borago, Cyclamen, Solanum, and many others, the filaments are very short compared with the style. Hence it became necessary, 1st. to furnish the stamens with long anthers. 2. To lengthen and bend the peduncles or flower-stalk, that the flower might hang downwards. 3. To reflect the petals. 4th. To erect these peduncles when the germ was fecundated. We may reason upon this by observing, that all this apparatus might have been spared, if the filaments alone had grown longer; and that thence in these flowers that the filaments are the most unchangeable parts; and that thence their comparative length, in respect to the style, would afford a most permanent mark of their generic character.

CURCUMA, l. 65. Turmeric. One male and one female inhabit this flower; but there are besides four imperfect males, or filaments, with-
Four beardless youths the obdurate beauty move
With soft attentions of Platonic love.

out anthers upon them, called by Linneus eunuchs. The flax of our country has ten filaments, and but five of them are terminated with anthers; the Portugal flax has ten perfect males, or flaments; the Verbena of our country has four males; that of Sweden has but two; the genus Albuca, the Bignonia Catalpa, Gratiola, and hemlock leaved Geranium have only half their filaments crowned with anthers. In like manner the florets, which form the rays of the flowers of the order frutaceous polygamy of the class Syngenesia, or confederate males, as the sun-flower, are furnished with a style only, and no stigma: and are thence barren. There is also a style without a stigma in the whole order dioecia gynandria; the male flowers of which are thence barren. The Opulus is another plant, which contains some unproductive flowers. In like manner some tribes of insects have males, females, and neuters among them: as bees, wasps, ants.

There is a curious circumstance belonging to the class of insects which have two wings, or diptera, analogous to the rudiments of flaments above described; viz. two little knobs are found placed each on a stalk or peduncle, generally under a little arched scale; which appear to be rudiments of hinder wings; and are called by Linneus, halteres, or poin- ters, a term of his introduction. A. T. Bladh. Amen. Acad. V. 7.

Other animals have marks of having in a long course of time undergone changes in some parts of their bodies, which may have been effected to accommodate them to new ways of procuring their food. The existence of teats on the breasts of male animals, and which are generally replete with a thin kind of milk at their nativity, is a wonderful instance of this kind. Perhaps all the productions of nature are in their progress to greater perfection; an idea countenanced by the modern discoveries and deductions concerning the progressive formation of the solid parts of the terraqueous globe, and consonant to the dignity of the Creator of all things.

These anther-lefs filaments seem to be an endeavour of the plant to produce more flaments, and would appear from some experiments of M. Reynier, instituted for another purpose: he cut away the flaments of many flowers, with design to prevent their fecundity, and in many instances the flower threw out new filaments from the wounded parts of different lengths; but did not produce new anthers. The experiments were made on the geum rivale, different kinds of mallows, and the echinops vitre. Critical Review for March, 1788.
With vain desires the pensive ALCEA burns,
And, like sad ELOISA, loves and mourns.
The freckled IRIS owns a fiercer flame,
And three unjealous husbands wed the dame.

ALCEA. l. 69. Flore pleno. Double hollyhock. The double flowers, so much admired by the florists, are termed by the botanist vegetable monsters; in some of these the petals are multiplied three or four times, but without excluding the stamens, hence they produce some seeds, as Campanula and Stramonium; but in others the petals become so numerous as totally to exclude the stamens, or males; as Caltha, Peonia, and Alcea; these produce no seeds, and are termed eunuchs. Philos. Botan. No. 150.

These vegetable monsters are formed in many ways. 1st. By the multiplication of the petals and the exclusion of the nectaries, as in Larkspur. 2d. By the multiplication of the nectaries and exclusion of the petals; as in Columbine. 3d. In some flowers growing in cymes, the wheel-shape flowers in the margin are multiplied to the exclusion of the bell-shape flowers in the centre; as in Guilder-rose. 4th. By the elongation of the florets in the centre. Instances of both these are found in Daisy and Feverfew; for other kinds of vegetable monsters, see Plantago.

The perianth is not changed in double flowers, hence the genus or family may be often discovered by the calyx, as in Hepatica, Ranunculus, Alcea. In those flowers, which have many petals, the lowest series of the petals remains unchanged in respect to number; hence the natural number of the petals is easily discovered. As in poppies, roses, and Nigella, or devil in a bush. Philos. Bot. p. 128.

IRIS. I. 71. Flower de Lucce. Three males, one female. Some of the species have a beautifully freckled flower; the large stigma or head of the female covers the three males, counterfeiting a petal with its divisions.

In the Persian Iris the end of the lower petal is purple, with white edges and orange streaks, creeping, as it were, into the mouth of the flower like an insect; by which deception in its native climate it probably prevents a similar insect from plundering it of its honey: the edges of the lower petal lap over those of the upper one, which prevents it from opening too wide on fine days, and facilitates its return at night; whence the rain is excluded, and the air admitted. See Polymorpha, Rubia, and Cypripedia in Vol. I.
Cupressus dark disdains his dusky bride,
One dome contains them, but two beds divide.
The proud Osiris flies his angry fair,
Two houses hold the fashionable pair.

Cupressus. 1. 73. Cypres. One House. The males live in separate flowers, but on the same plant. The males of some of these plants, which are in separate flowers from the females, have an elastic membrane; which disperses their dust to a considerable distance, when the anthers burst open. This dust, on a fine day, may often be seen like a cloud hanging round the common nettle. The males and females of all the cone-bearing plants are in separate flowers, either on the same or on different plants; they produce refining, and many of them are supposed to supply the most durable timber: what is called Venice-turpentine is obtained from the larch by wounding the bark about two feet from the ground, and catching it as it exudes; Sandarach is procured from common juniper; and Incense from a juniper with yellow fruit. The unperishable chests, which contain the Egyptian mummies, were of Cypres; and the Cedar, with which black lead pencils are covered, is not liable to be eaten by worms. See Miln's Bot. Dict. art. conifer. The gates of St. Peter's church at Rome, which had lasted from the time of Constantine to that of Pope Eugene the fourth, that is to say eleven hundred years, were of Cypres, and had in that time suffered no decay. According to Thucydides, the Athenians buried the bodies of their heroes in coffins of Cypres, as being not subject to decay. A similar durability has also been ascribed to Cedar, Thus Horace,

——— speramus carmina fingi
Poffelinenda cedro, & teco servanda cupresso.

Osiris. 1. 75. Two houses. The males and females are on different plants. There are many instances on record, where female plants have been impregnated at very great distance from their male; the dust discharged from the anthers is very light, small, and copious, so that it may spread very wide in the atmosphere, and be carried to the distant pistils, without the supposition of any particular attraction; these plants resemble some insects, as the ants, and cochineal insect, of which the males have wings, but not the female.
With strange deformity Plantago treads,
A Monster-birth! and lifts his hundred heads;
Yet with soft love a gentle belle he charms,
And clasps the beauty in his hundred arms.

So hapless Desdemona, fair and young.
Won by Othello's captivating tongue,
Sigh'd o'er each strange and piteous tale, distress'd,
And sunk enamour'd on his footy breast.

Two gentle shepherds and their sister-wives
With thee, Anthoxa! lead ambrosial lives;

Plantago. I. 77. Rofea. Rose Plantain. In this vegetable monster the bractes, or divisions of the spike, become wonderfully enlarged; and are converted into leaves. The chaffy scales of the calyx in Xeranthemum, and in a species of Dianthus, and the glume in some alpine grasses, and the scales of the ament in the Salix rosea, rose willow, grow into leaves; and produce other kinds of monsters. The double flowers become monsters by the multiplication of their petals or nectaries. See note on Alcea.

Anthoxanthum. I. 83. Vernal grasses. Two males, two females. The other grasses have three males and two females. The flowers of this grass give the fragrant scent to hay. I am informed it is frequently viviparous, that is, that it bears sometimes roots or bulbs instead of seeds, which after a time drop off and strike root into the ground. This circumstance is said to obtain in many of the alpine grasses, whose seeds are perpetually devoured by small birds. The Festuca Dumetorum, fescue grass of the bulhes, produces bulbs from the sheaths of its straw. The Allium Magicum, or magical onion, produces onions on its head, instead of seeds. The Polygonum Viviparum, viviparous bifort, rises about a foot high, with a beautiful spike of flowers, which are succeed-ed by buds or bulbs, which fall off and take root. There is a bulb frequently seen on birch-trees, like a bird's nest, which seem to be a similar attempt of nature, to produce another tree; which falling off might take root in spongy ground.

There is an instance of this double mode of production in the animal kingdom, which is equally extraordinary: the same species of Aphis is viviparous in summer, and oviparous in autumn. A. T. Bladh. Amoen. Acad. V. 7.
Where the wide heath in purple pride extends,
And scatter’d furze its golden luftre blends,
Closed in a green recess, unenvy’d lot!
The blue fnoak rises from their turf-built cot;
Bosom’d in fragrance blufh their infant train,
Eye the warm sun, or drink the silver rain.

The fair Osmunda seeks the silent dell,
The ivy canopy, and dripping cell;
There hid in shades clandestine rites approves,
Till the green progeny betrays her loves.

With charms despotick fair Chondrilla reigns
O’er the soft hearts of five fraternal swains;

Osmunda. l. 93. This plant grows on moist rocks; the parts of its
flower or its seeds are scarce discernible; whence Linneus has given the
name of clandestine marriage to this class. The younger plants are of a
beautiful vivid green.

Chondrilla. l. 97. Of the class Confederate Males. The numerous
florets, which constitute the disk of the flowers in this class, contain in
each five males, surrounding one female, which are connected at top,
whence the name of the class. An Italian writer, in a discourse on the
irritability of flowers, afferts, that if the top of the florret be touched, all
the filaments which support the cylindrical anther will contract them-
selves, and that by thus raising or depreffing the anther the whole of the
prolific dust is collected on the stigma. He adds, that if one filament be
touched after it is separated from the florret, that it will contract like the
muscular fibres of animal bodies, his experiments were tried on the
Centauréa Calceiropoides, and on artichokes, and globe-thistles. Disc-
ourse on irritability of plants. Dodley.

In the natural state of the expanded flower of the barberry, the sta-
mens lie on the petals; under the concave summits of which the anthers
shelter themselves, and in this situation remain perfectly rigid; but on
touching the inside of the filament near its base with a fine briffle, or
blunt needle, the flamen infantly bends upwards, and the anther, em-
bracing the stigma, feds its dust. Observations on the Irritation of
Vegetables, by T. E. Smith, M. D.
If sighs the changeful nymph, alike they mourn;
And, if she smiles, with rival raptures burn.
So, turn'd in unison, Eolian Lyre!
Sounds in sweet symphony thy kindred wire;
Now, gently swept by Zephyr's vernal wings,
Sink in soft cadences the love-sick string;
And now with mingling chords, and voices higher,
Peal the full anthems of the aerial choir.

Five sister-nymphs to join Diana's train
With thee, fair LYCHNIS! vow,—but vow in vain;
Beneath one roof resides the virgin band,
Flies the fond swain, and scorns his offer'd hand;
But when soft hours on breezy pinions move,
And smiling May attunes her lute to love,
Each wanton beauty, trick'd in all her grace,
Shakes the bright dew-drops from her blushing face;
In gay undress displays her rival charms,
And calls her wondering lovers to her arms.

When the young Hours amid her tangled hair
Wove the fresh rose-bud, and the lily fair,
Proud GLORIOSA led three chosen swains,
The blushing captives of her virgin chains——

LYCHNIS. l. 108. Ten males and five females. The flowers which contain the five females, and those which contain the ten males, are found on different plants; and often at a great distance from each other. Five of the ten males arrive at their maturity some days before the other five, as may be seen by opening the corol before it naturally expands itself. When the females arrive at their maturity, they rise above the petals, as if looking abroad for their distant husbands; the scarlet ones contribute much to the beauty of our meadows in May and June.

GLORIOSA. l. 119. Sperba. Six males, one female. The petals of this beautiful flower with three of the flamens, which are first mature,
When Time's rude hand a bark of wrinkles spread
Round her weak limbs, and silver'd o'er her head,
Three other youths her riper years engage,
The flatter'd victims of her wily age.

So, in her wane of beauty, Ninon won
With fatal smiles her gay unconscious son.—
Clasp'd in his arms she own'd a mother's name,—
"Desist, rash youth! restrain your impious flame,
"First on that bed your infant-form was pres't,
"Born by my throes, and nurtured at my breast."—

Back as from death he sprung, with wild amaze
Fierce on the fair he fix'd his ardent gaze;
Dropp'd on one knee, his frantic arms outspread,
And stole a guilty glance towards the bed;
Then breath'd from quivering lips a whisper'd vow,
And bent on heaven his pale repentant brow;

stand up in apparent disorder; and the pistil bends at nearly a right angle to insert its stigma among them. In a few days, as these decline, the other three stamens bend over, and approach the pistil. In the Fritillaria Persica, the six stamens are of equal lengths, and the anthers lie a distance from the pistil, and three alternate ones approach first; and, when these decline, the other three approach: in the Lithrum Salicaria, (which has twelve males and one female) a beautiful red flower, which grows on the banks of rivers, six of the males arrive at maturity, and surround the female some time before the other six; when these decline, the other six rise up, and supply their places. Several other flowers have in similar manner two sets of stamens of different ages, as Adoxa, Lychnis, Saxifraga. See Geniflæ. Perhaps a difference in the time of their maturity obtains in all these flowers, which have numerous stamens. In the Kalmia the ten stamens lie round the pistil like the radii of a wheel; and each anther is concealed in a niche of the corol to protect it from cold and moisture; these anthers rise separately from their niches, and approach the pistil for a time, and then recede to their former situations.
"Thus, thus!" he cried, and plung’d the furious dart,  
And life and love gush’d mingled from his heart.

The fell Silene and her sisters fair,  
Skill’d in destruction, spread the viscid snare.
The harlot-band *ten* lofty bravoes screen,
And frowning guard the magic nets unseen.—
Hasten glittering nations, tenants of the air,
Oh, fleeer from hence your viewless course afar!
If with soft words, sweet blushes, nods, and smiles, 145
The *three* dread Syrens lure you to their toils,
Limed by their art in vain you point your stings,
In vain the efforts of your whirring wings!—
Go, seek your gilded mates and infant hives,
Nor taste the honey purchas'd with your lives! 150

When heaven's high vault condensing clouds deform,
Fair *Amaryllis* flies the incumbent storm,
closer, and with such violence as to detain the fly, which thus generally perishes. This account was related to me by R. W. Darwin, Esq; of Elston, in Nottinghamshire, who showed me the plant in flower, July 2d, 1788, with a fly thus held fast by the end of its proboscis, and was well seen by a magnifying lens, and which in vain repeatedly struggled to disengage itself, till the converging anthers were separated by means of a pin; on some days he had observed that almost every flower of this elegant plant had a fly in it thus entangled; and a few weeks afterwards favoured me with his further observations on this subject.

"My *Apocynum* is not out of flower. I have often visited it, and have frequently found four or five flies, some alive, and some dead, in its flower; they are generally caught by the trunk or proboscis, sometimes by the trunk and a leg; there is one at present only caught by a leg: I don't know that this plant sleeps, as the flowers remain open in the night; yet the flies frequently make their escape. In a plant of Mr. Ordino's, an ingenious gardener at Newark, who is possessed of a great collection of plants, I saw many flowers of an *Apocynum* with three dead flies in each; they are a thin-bodied fly, and rather less than the common house-fly; but I have seen two or three other sorts of flies thus arrested by the plant. Aug. 12, 1788."
Seeks with unsteady step the shelter'd vale,
And turns her blushing beauties from the gale.—

Six rival youths, with soft concern impress'd,
Calm all her fears, and charm her cares to rest.—

So shines at eve the sun-illumin'd fane,
Lift its bright crofs, and waves its golden vane;

night, or in rainy or cold weather, as the convolvulus, and thus protect
their included flaments and pistils. Other bell-flowers hang their apertu-
tures downwards, as many of the lilies; in thoce the pistil, when at ma-
turity, is longer than the flaments; and by this pendant attitude of the
bell, when the anthers burst, their dust falls on the stigma: and these
are at the same time sheltered as with an umbrella from rain and dews.
But, as a free exposure to the air is necessary for their fecundation, the
style and filaments in many of these flowers continue to grow longer af-
ter the bell is open, and hang down below its rim. In others, as in the
martagon, the bell is deeply divided, and the divisions are reflected up-
wards, that they may not prevent the access of air, and at the same
time afford some shelter from perpendicular rain or dew. Other bell-
flowers, as the hemerocallis and amaryllis, have their bells nodding
only, as it were, or hanging obliquely towards the horizon; which,
as their stems are slender, turn like a weathercock from the wind; and
thus very effectually preserve their inclosed flaments and anthers from
the rain and cold. Many of these flowers, both before and after their
feason of fecundation, erect their heads perpendicular to the horizon,
like the Medalia, which cannot be explained from mere mechanifm.

The Amaryllis formosifima is a flower of the last mentioned kind, and
affords an agreeable example of art in the vegetable economy 1. The
pistil is of great length compared with the flaments: and this I suppose
to have been the most unchangeable part of the flower, as in Medalia,
which see. 2. To counter act this circumstance, the pistil and flaments
are made to decline downwards, that the prolific dust might fall from the
anthers on the stigma. 3. To produce this effect, and to secure it when
produced, the corol is lacerated, contrary to what occurs in other flow-
er's of this genus, and the lowest division with the two next lowest ones
are wrapped closely over the style and filaments, binding them forcibly
down lower towards the horizon than the usual inclination of the bell
in this genus, and thus constitutes a most elegant flower. There is
another contrivance for this purpose in the Hemerocallis flava: the long
pistil often is bent somewhat like the capital letter N, with design to
shorten it, and thus to bring the stigma amongst the anthers,
From every breeze the polish'd axle turns,
And high in air the dancing meteor burns.

Four of the giant brood with Ilex stand,
Each grasps a thousand arrows in his hand;

Ilex. l. 161. Holly. Four males, four females. Many plants, like
many animals, are furnished with arms for their protection; these are
either aculei, prickles, as in rose and barberry, which are formed from
the outer bark of the plant; or spinæ, thorns, as in hawthorn, which
are an elongation of the wood, and hence more difficult to be torn off
than the former; or stimuli, stings, as in the nettles, which are armed
with a venomous fluid for the annoyance of naked animals. The shrubs
and trees, which have prickles or thorns, are grateful food to many ani-
mals, as gooseberry, and gorse; and would be quickly devoured, if not
thus armed; the stings seem a protection against some kinds of insects,
as well as the naked mouths of quadrupeds. Many plants lose their
thorns by cultivation, as wild animals lose their ferocity; and some of
them their horns. A curious circumstance attends the large hollies in
Needwood-forest, they are armed with thorny leaves about eight feet
high, and have smooth leaves above; as if they were conscious that
horses and cattle could not reach their upper branches. See note on
Meadia, and on Mancinella. The numerous clumps of hollies in Need-
wood-forest serve as landmarks to direct the travellers across it in vari-
os directions; and as a shelter to the deer and cattle in winter; and in
scarcie seasons supply them with much food. For when the upper
branches, which are without prickles, are cut down, the deer crop the
leaves and peel off the bark. The bird-lime made from the bark of hol-
lies seems to be a very similar material to the elastic gum, or Indian rub-
ber, as it is called. There is a fossil elastic bitumen found at Matlock
in Derbyshire, which much resembles these substances in its elasticity
and inflammability. The thorns of the mimofa cornigere resemble
cow's horns in appearance as well as in use. System of Vegetables,
p. 782.

The efficient cause which renders the hollies prickly in Needwood-
Forest only as high as the animals can reach them, may arise from the
lower branches being constantly cropped by them, and thus shoot forth
more luxuriant foliage; it is probable the shears in garden-hollies may
produce the same effect, which is equally curious, as prickles are not
thus produced on other plants.
So Wright's bold pencil from Vesuvio's height 175
Hurls his red lavas to the troubled night;
From Calpè starts the intolerable flash,
Skies burst in flames, and blazing oceans dash;—
Or bids in sweet repose his shades recede,
Winds the still vale, and slopes the velvet mead;
On the pale stream expiring Zephyrs sink,
And Moonlight sleeps upon its hoary brink.

Gigantic Nymph! the fair Kleinovia reigns,
The grace and terror of Orixa's plains;

Hurls his red lavas. l. 176. Alluding to the grand paintings of the eruptions of Vesuvius, and of the destruction of the Spanish vessels before Gibraltar; and to the beautiful landscapes and moonlight scenes, by Mr. Wright of Derby.

Kleinovia. l. 183. In this class the males in each flower are supported by the female. The name of the class may be translated "Viragoes," or "Feminine males."

The largest tree perhaps in the world is of the same natural order as Kleinovia, it is the Adansonia, or Ethiopian Sour-gourd, or African.
From every breeze the polish’d axle turns,
And high in air the dancing meteor burns.

Four of the giant brood with Ilex stand,
Each grasps a thousand arrows in his hand;

*Ilex*. I. 16t. Holly. Four males, four females. Many plants, like many animals, are furnished with arms for their protection; these are either aculei, prickles, as in rose and barberry, which are formed from the outer bark of the plant; or spinæ, thorns, as in hawthorn, which are an elongation of the wood, and hence more difficult to be torn off than the former; or stimuli, stings, as in the nettles, which are armed with a venomous fluid for the annoyance of naked animals. The shrubs and trees, which have prickles or thorns, are grateful food to many animals, as gooseberry, and gorfe; and would be quickly devoured, if not thus armed; the stings seem a protection against some kinds of insects, as well as the naked mouths of quadrupeds. Many plants lose their thorns by cultivation, as wild animals lose their ferocity; and some of them their horns. A curious circumstance attends the large hollies in Needwood-forest, they are armed with thorny leaves about eight feet high, and have smooth leaves above; as if they were conscious that horses and cattle could not reach their upper branches. See note on Meadia, and on Mancinella. The numerous clumps of hollies in Needwood-forest serve as land-marks to direct the travellers across it in various directions; and as a shelter to the deer and cattle in winter; and in scarce seasons supply them with much food. For when the upper branches, which are without prickles, are cut down, the deer crop the leaves and peel off the bark. The bird-lime made from the bark of hollies seems to be a very similar material to the elastic gum, or Indian rubber, as it is called. There is a fossil elastic bitumen found at Matlock in Derbyshire, which much resembles these substances in its elasticity and inflammability. The thorns of the mimôa cornigere resemble cow’s horns in appearance as well as in use. *System of Vegetables*, p. 732.

The efficient cause which renders the hollies prickly in Needwood-Forest only as high as the animals can reach them, may arise from the lower branches being constantly cropped by them, and thus shoot forth more luxuriant foliage; it is probable the shears in garden-hollies may produce the same effect, which is equally curious, as prickles are not thus produced on other plants.
A thousand fiercely points on every scale
Form the bright terrors of his briefly male.—
So arm’d, immortal Moore uncharm’d the spell,
And flew the wily dragon of the well.—
Sudden with rage their injur’d bosoms burn,
Retort the infult, or the wound return;
Unwrong’d, as gentle as the breeze that sweeps
The unbending harvests or undimpled deeps,
They guard, the Kings of Needwood’s wide domains,
Their sister-wives and fair infantine trains;
Lead the lone pilgrim through the trackless glade,
Or guide in leafy wilds the wand’ring maid.

So Wright’s bold pencil from Vesuvio’s height
Hurls his red lavas to the troubled night;
From Calpè starts the intolerable flash,
Skies burst in flames, and blazing oceans dash;—
Or bids in sweet repose his shades recede,
Winds the still vale, and slopes the velvet mead;
On the pale stream expiring Zephyrs sink,
And Moonlight sleeps upon its hoary brink.

Gigantic Nymph! the fair Kleinhowia reigns,
The grace and terror of Orixa’s plains;

Hurls his red lavas. l. 176. Alluding to the grand paintings of the eruptions of Vesuvius, and of the destruction of the Spanish vessels before Gibraltar; and to the beautiful landscapes and moonlight scenes, by Mr. Wright of Derby.

Kleinhowia. l. 183. In this class the males in each flower are supported by the female. The name of the class may be translated “Viragoes,” or “Feminine males.”
The largest tree perhaps in the world is of the same natural order as Kleinhowia, it is the Adamfortia, or Ethiopian Sour-gourd, or African
O'er her warm cheek the blush of beauty swims,
And nerves Herculean bend her sinewy limbs;
With frolic eye she views the affrighted throng,
And shakes the meadows, as she towers along,
With playful violence displays her charms,
And bears her trembling lovers in her arms.

So fair Thalestris shook her plumy crest,
And bound in rigid mail her jutting breast;
Poised her long lance amid the walks of war,
And beauty thunder'd from Bellona's car;
Greece arm'd in vain, her captive heroes wove
The chains of conquest with the wreaths of love.

When o'er the cultured lawns and dreary waftes
Retiring Autumn flings her howling blasts,
Bends in tumultuous waves the struggling woods,
And showers their leafy honours on the floods,
In withering heaps collects the flowery spoil,
And each chill insect sinks beneath the soil;
Quick flies fair Tulipa the loud alarms,
And folds her infant clover in her arms;

Calabash tree. Mr. Adanson says the diameter of the trunk frequently exceeds 25 feet, and the horizontal branches are from 45 to 55 feet long, and so large that each branch is equal to the largest trees of Europe. The breadth of the top is from 120 to 150 feet. And one of the roots bared only in part by the washing away of the earth by the river, near which it grew, measured 110 feet long; and yet these stupendous trees never exceed 70 feet in height. Voyage to Senegal.

Tulipa. 1. 205. Tulip. What is in common language called a bulbous root, is by Linneus termed the Hybernacle, or Winter-lodge of the young plant. These bulbs in every respect resemble buds, except in their being produced under ground, and include the leaves and flower in miniature, which are to be expanded in the ensuing spring: By cautiously cutting in the early spring through the concentric coats of a tulip-root, longitudinally from the top to the base, and taking them
In some lone cave, secure pavilion, lies,
And waits the courtship of serener skies.—
So, fix cold moons, the Dormouse charm'd to rest,
Indulgent Sleep! beneath thy elder breast,
In fields of Fancy climbs the kernel'd groves,
Or shares the golden harvest with his loves.—
But bright from earth amid the troubled air
Ascends fair Colchica with radiant hair,
C 2

off successively, the whole flower of the next summer's tulip is beautifully seen by the naked eye, with its petals, pistil, and stamens; the flowers exist in other bulbs, in the same manner as in Hyacinths, but the individual flowers of these being less, they are not so easily distinguished, or so conspicuous to the naked eye.

In the seed of the Nymphae Nelumbo, the leaves of the plant are seen so distinctly, that Mr. Ferber found out by them to what plant the seeds belonged. Amoen. Acad. V. vi. No. 120. He says that Mariotte first observed the future flower and foliage in the bulb of a Tulip; and adds, that it is pleasant to see in the buds of the Hepatica, and Pedicularis hirsuta, yet lying in the earth; and in the gems of Daphne Mezereon; and at the base of Ofmunda Lunaria, a perfect plant of the future year complete in all its parts. Ibid.

Colchicum autumnale. l. 214. Autumnal Meadow-Saffron. Six males, three females. The germ is buried within the root, which thus seems to constitute a part of the flower. Families of Plants, p. 242. These singular flowers appear in the autumn without any leaves, whence in some countries they are called Naked Ladies: in the March following the green leaves spring up, and in April the seed-veil rises from the ground; the seeds ripen in May, contrary to the usual habits of vegetables, which flower in the spring, and ripen their seeds in the autumn. Miller's Dict. The juice of the root of this plant is so acrid as to produce violent effects on the human constitution, which also prevents it from being eaten by subterranean insects, and thus guards the seed-veil during the winter. The defoliation of deciduous trees is announced by the flowering of the Colchicum; of these the ash is the last that puts forth its leaves, and the first that loses them. Phil. Bot. p. 275.

The Hamamelis, Witch Hazle, is another plant which flowers in autumn; when the leaves fall off, the flowers come out in clusters from
Warms the cold bosom of the hoary year,
And lights with Beauty's blaze the dusky sphere.
Three blushing Maids the intrepid Nymph attend,
And six gay Youths, enamour'd train! defend.
So shines with silver guards the Georgian star,
And drives on Night's blue arch his glittering car;
Hangs o'er the billowy clouds his lucid form,
Wades thro' the mist, and dances in the storm.

Great Helianthus guides o'er twilight plains
In gay solemnity his Dervise-trains;
Marshall'd in fives each gaudy band proceeds,
Each gaudy band a plumed Lady leads;

the joints of the branches, and in Virginia ripen their seed in the ensuing spring, but in this country their seeds seldom ripen. Lin. Spec. Plant. Miller's Dict.

Helianthus. l. 223. Sun-flower. The numerous florets, which constitute the disk of this flower, contain in each five males surrounding one female, the five stamens have their anthers connected at top, whence the name of the class "confederate males;" see note on Chondrilla. The sun-flower follows the course of the sun by nutation, not by twilling its stem. (Hales veg. flat.) Other plants, when they are confined in a room, turn the shining surface of their leaves, and bend their whole branches to the light. See Mimosa.

A plumed Lady leads. l. 226. The seeds of many plants of this class are furnished with a plume, by which admirable mechanism they are disseminated by the winds far from their parent stem, and look like a shuttlecock, as they fly. Other seeds are disseminated by animals; of these some attach themselves to their hair or feathers by a gluten, as millet; others by hooks, as cleavers, burdock, hounds-tongue; and others are swallowed whole for the sake of the fruit, and voided uninjured, as the hawthorn, juniper, and some grasses. Other seeds again disperse themselves by means of an elastic seed-vessel, as Oats, Geranium, and Impatiens; and the seeds of aquatic plants, and of those which grow on the banks of rivers, are carried many miles by the currents, into which they fall. See Impatiens, Zoster, Caffia, Carlina.
With zealous step he climbs the upland lawn,
And bows in homage to the rising dawn;
Imbibes with eagle-eye and golden ray,
And watches, as it moves, the orb of day.

Queen of the marsh, imperial Drosera treads
Rush-fringed banks, and moss-embroider'd beds;
Redundant folds of glossy silk surround
Her flender waist, and trail upon the ground;
Five forest-nymphs collect with graceful ease,
Or spread the floating purple to the breeze;
And five fair youths with duteous love comply
With each soft mandate of her moving eye.
As with sweet grace her snowy neck she bows,
A zone of diamonds trembles round her brows;
Bright shines the silver halo, as she turns;
And, as she steps, the living lustre burns.

Drosera. I. 231. Sun-dew. Five males, five females. The leaves of this marsh-plant are purple, and have a fringe very unlike other vegetable productions. And, which is curious, at the point of every thread of this erect fringe stands a pellucid drop of mucilage, resembling a ducal coronet. This mucus is a secretion from certain glands, and like the viscid material round the flower-flanks of Silene (catchfly) prevents small insects from infesting the leaves. As the ear-wax in animals seems to be in part designed to prevent fleas and other insects from getting into their ears. See Silene. Mr. Wheatley, an eminent surgeon in Cateaton-street, London, observed these leaves to bend upwards, when an insect settled on them, like the leaves of the muscipula Venus, and pointing all their globules of mucus to the centre, that they completely intangled and destroyed it. M. Broussonet, in the Mem. de l'Acad, des Sciences for the year 1784, p. 615. after having described the motion of the Dionaea, adds, that a similar appearance has been observed in the leaves of two species of Drosera.
Fair Lonicera prints the dewy lawn,
And decks with brighter blush the vermil dawn;

Lonicera. l. 243. Caprifolium. Honeysuckle. Five males, one female. Nature has in many flowers used a wonderful apparatus to guard the nectar, or honey-gland, from insects. In the honey-suckle the petal terminates in a long tube like a cornucopia, or horn of plenty; and the honey is produced at the bottom of it. In Aconitum, monks' head, the nectaries stand upright like two horns covered with a hood, which abounds with such acrid matter that no insects penetrate it. In Helleborus, hellebore, the many nectaries are placed in a circle, like little pitchers, and add much to the beauty of the flower. In the Columbine, Aquilegia, the nectary is imagined to be like the neck and body of a bird, and the two petals standing upon each side represent wings; whence its name of columbine, as if resembling a nest of young pigeons fluttering whilst their parent feeds them. The importance of the nectary in the economy of vegetation is explained at large in the notes on part the first.

Many insects are provided with a long and pliant proboscis for the purpose of acquiring this grateful food, as a variety of bees, moths, and butterflies; but the Sphinx Convolvuli, or unicorn moth, is furnished with the most remarkable proboscis in this climate. It carries it rolled up in concentric circles under its chin, and occasionally extends it to above three inches in length. This trunk consists of joints and muscles, and seems to have more versatile movements than the trunk of the elephant; and near its termination is split into two capillary tubes. The excellence of this contrivance for robbing the flowers of their honey, keeps this beautiful insect fat and bulky; though it flies only in the evening, when the flowers have closed their petals; and are thence more difficult of access; at the same time the brilliant colours of the moth contribute to its safety, by making it mistaken by the late sleeping birds for the flower it rels on.

Besides these there is a curious contrivance attending the Ophrys, commonly called the Bee-orchis, and the Fly-orchis, with some kinds of the Delphinium, called Bee-larkspurs, to preserve their honey; in these the nectary and petals resemble in form and colour the insects, which plunder them: and thus it may be supposed, they often escape these hourly robbers, by having the appearance of being pre-occupied. See note on Rubia, and Conflava polymorpha.
Winds round the shadoowy rocks, and pansied vales, 245
And scents with sweeter breath the summer-gales;
With artless grace and native ease the charms,
And bears the Horn of Plenty in her arms.
Five rival Swains their tender cares unfold,
And watch with eye askance the treasured gold.

Where rears huge Tenerif his azure crest,
Aspiring Draba builds her eagle nest;
Her pendant cyry icy caves surround,
Where erst Volcanos min’d the rocky ground.
Pleased round the Fair four rival Lords ascend
The shaggy steepès, two menial youths attend.
High in the setting ray the beauty stands,
And her tall shadow waves on distant lands.

Stay, bright inhabitant of air, alight,
Ambitious Visca, from thy eagle-flight!—

Draba. l. 252. Alpina. Alpine Whitlow-grafs. One female and six males. Four of these males stand above the other two; whence the name of the class "four powers." I have observed in several plants of this class, that the two lower males arise, in a few days after the opening of the flower, to the same height as the other four, not being mature as soon as the higher ones. See note on Gloriosa. All the plants of this class possess similar virtues; they are termed acrid and antiscorbutic in their raw state, as mustard, watercrefs; when cultivated and boiled, they become a mild wholesome food, as cabbage, turnep.

There was formerly a Volcano on the Peake of Tenerif, which became extinct about the year 1684. Philos. Trans. In many excavations of the mountain, much below the summit, there is now found abundance of ice at all seasons. Tench's Expedition to Botany Bay, p. 12. Are these congelations in consequence of the daily solution of the hoar-frost which is produced on the summit during the night?

Viscum. l. 260. Mistletoe, Two houses. This plant never grows upon the ground; the foliage is yellow, and the berries milk-white; the
Scorning the fordid foil, aloft the springs,
Shakes her white plume, and claps her golden wings;
High o'er the fields of boundless ether roves,
And secks amid the clouds her soaring loves!

Stretch'd on her mossy couch, in trackless deeps, 265
Queen of the coral groves, ZOSTERA sleeps;

berries are so viscous, as to serve for bird-lime; and when they fall, adhere to the branches of the tree, on which the plant grows, and strike root into its bark; or are carried to distant trees by birds. The Tillandisia, or wild pine, grows on other trees, like the Milletoe, but takes little or no nourishment from them, having large buckets in its leaves to collect and retain the rain water. See note on Dyphasis. The moffs, which grow on the bark of trees, take much nourishment from them; hence it is observed that trees, which are annually cleared from moss by a brush, grow nearly twice as fast. (Phil. Transact.) In the cyder countries the peafants bruith their apple-trees annually.

ZOSTERA. 1. 266. Grafs-wrack. Clafs, Feminine Males. Order, Many Males. It grows at the bottom of the sea, and rising to the surface, when in flower, covers many leagues; and is driven at length to the shore. During its time of floating on the sea, numberless animals live on the under surface of it; and being specifically lighter than the sea water, or being repelled by it, have legs placed as if they were on their backs for the purpose of walking under it. As the Scyllæa. See Barbut's Genera Vermium. It seems necessary that the marriages of plants should be celebrated in the open air, either because the powder of the anther, or the mucilage on the stigma, or the reservoir of honey might receive injury from the water. Mr. Needham observed, that in the ripe dust of every flower, examined by the microscope, some vesicles are perceived, from which a fluid had escaped; and that these, which still retain it, explode if they be wetted, like an eolopile suddenly exposed to a strong heat. The observations have been verified by Spallanzani and others. Hence rainy seasons make a scarcity of grain, or hinder its fecundity by bursting the pollen before it arrives at the moist stigma of the flower. Spallanzani's Dissertations, v. 11. p. 321. Thus the flowers of the male Vallifneria are produced under water, and when ripe detach themselves from the plant, and rising to the surface are wafted by the air to the female flowers. See Vallifneria.
The silvery sea-weed matted round her bed,
And distant surges murmuring o'er her head.—
High in the flood her azure dome ascends,
The crystal arch on crystal columns bends;
Roof'd with translucent shell the turrets blaze,
And far in ocean dart their colour'd rays;
O'er the white floor successive shadows move,
As rise and break the ruffled waves above.—
Around the nymph her mermaid-trains repair,
And weave with orient pearl her radiant hair;
With rapid fins she cleaves the watery way,
Shoots like a silver meteor up to day;
Sound a loud conch, convokes a scaly band,
Her sea-born lovers, and ascends the strand.

E'en round the pole the flames of Love aspire,
And icy bosoms feel the secret fire!—
Cradled in snow and fann'd by arctic air
Shines, gentle Barometz! thy golden hair;

Barometz. l. 284. Polypodium Barometz. Tartarian Lamb. Clan-
defline Marriage. This species of Fern is a native of China, with a do-
cumbent root, thick, and everywhere covered with the most soft and

This curious stem is sometimes pushed out of the ground in its hori-
zontal situation by some of the inferior branches of the root, so as to
give it some resemblance to a Lamb standing on four legs; and has been
fain to destroy all other plants in its vicinity. Sir Hans Sloane describes
it under the name of Tartarian Lamb, and has given a print of it. Phil-
of. Trans. abridged, v. ii. p. 646. but thinks some art had been used
to give it an animal appearance. Dr. Hunter, in his edition of the
Terra of Evelyn, has given a more curious print of it, much resembling
a sheep. The down is used in India externally for flopping hemorrhages,
and is called golden mofs.

The thick downy clothing of some vegetables seems designed to pro-
tect them from the injuries of cold, like the wool of animals. Those
bodies, which are bad conductors of electricity, are also bad conductors
Rooted in earth each cloven hoof descends,
And round and round her flexile neck she bends;
Crops the grey coral moss, and hoary thyme,
Or laps with rosy tongue the melting rime;
Eyes with mute tenderness her distant dam,
Or seems to bleat, a Vegetable Lamb.
—So, warm and buoyant in his oily mail,
Gambols on seas of ice the unwieldy Whale;
Wide-waving fins round floating islands urge
His bulk gigantic through the troubled surge;
With hideous yawn the flying hoals he seeks,
Or claps with fringe of horn his maffly cheeks;
Lifts o'er the tossing wave his nostrils bare,
And spouts pellucid columns into air;
The silvery arches catch the setting beams,
And transient rainbows tremble o'er the streams.

of heat, as glass, wax, air. Hence either of the two former of these may be melted by the flame of a blow-pipe very near the fingers which hold it without burning them; and the last, by being confined on the surface of animal bodies, in the interstices of their fur or wool, prevents the escape of their natural warmth; to which should be added, that the hairs themselves are imperfect conductors. The fat or oil of whales, and other northern animals, seems designed for the same purpose of preventing the too sudden escape of the heat of the body in cold climates. Snow protects vegetables which are covered by it from cold, both because it is a bad conductor of heat itself, and contains much air in its pores. If a piece of camphor be immersed in a snow-ball, except one extremity of it, on setting fire to this, as the snow melts, the water becomes absorbed into the surrounding snow by capillary attraction; on this account, when living animals are buried in snow, they are not moistened by it; but the cavity enlarges as the snow dissolves, affording them both a dry and warm habitation.
Weak with nice sense, the chaste MIMOSA stands,
From each rude touch withdraws her timid hands;
Oft as light clouds o'er-pass the Summer-glade,
Alarm'd the trembles at the moving shade;
And feels, alive through all her tender form,
The whisper'd murmurs of the gathering storm;
Shuts her sweet eye-lids to approaching night;
And hails with freshen'd charms the rising light.

Veil'd, with gay decency and modest pride,
Slow to the mosque she moves, an eastern bride;
There her soft vows unceasing love record,
Queen of the bright seraglio of her Lord.

Mimosa. I. 301. The sensitive plant. Of the class Polygamy, one house. Naturalists have not explained the immediate cause of the collapsing of the sensitive plant; the leaves meet and close in the night during the sleep of the plant, or when exposed to much cold in the daytime, in the same manner as when they are affected by external violence, folding their upper surfaces together, and in part over each other like scales or tiles; so as to expose as little of the upper surface as may be to the air; but do not indeed collapse quite so far, since I have found, when touched in the night during their sleep, they fall still further, especially when touched on the foot-flalks between the stems and the leaflets, which seems to be their most sensitive or irritable part. Now as their situation after being exposed to external violence resembles their sleep, but with a greater degree of collapse, may it not be owing to a numbness or paralysis consequent to too violent irritation, like the faintings of animals from pain or fatigue? I kept a sensitive plant in a dark room till some hours after day-break; its leaves and leaf-flalks were collapsed as in its most profound sleep, and on exposing it to the light, above twenty minutes passed before the plant was thoroughly awake and had quite expanded itself. During the night the upper or smoother surface of the leaves are appressed together; this would seem to show that the office of this surface of the leaf was to expose the fluids of the plant to the light as well as to the air. See note on Helianthus. Many flowers close up their petals during the night. See note on vegetable respiration in Part I.
So sinks or rises with the changeful hour
The liquid silver in its glassy tower.
So turns the needle to the pole it loves,
With fine librations quivering as it moves.

All wan and shivering in the leafless glade
The sad Anemone reclined her head;
Grief on her cheeks had paled the roteate hue,
And her sweet eye-lips dropp’d with pearly dew,
—“See from bright regions, borne on odorous gales
“The Swallow, herald of the summer, fails;

Anemone. l. 318. Many males, many females, Pliny says this flower
never opens its petals but when the wind blows: whence its name: it has
properly no calix, but two or three sets of petals, three in each set,
which are folded over the flammens and piftil in a singular and beautiful
manner, and differs also from ranunculus in not having a melliferous
pore on the claw of each petal.

The Swallow. l. 322. There is a wonderful conformity between the
vegetation of some plants, and the arrival of certain birds of passage.
Linneus observes that the wood anemone blows in Sweden on the arri-
val of the swallow; and the marsh marigold, Caltha, when the cu-
koo sings. Near the same coincidence was observed in England by Stil-
lingfleet. The word Coccus in Greek signifies both a young fig and a
cuckoo, which is supposed to have arisen from the coincidence of their
appearance in Greece. Perhaps a similar coincidence of appearance
in some parts of Asia gave occasion to the story of the love of the rose
and nightingale, so much celebrated by the eastern poets. See Dian-
thus. The times however of the appearance of vegetables in the spring
seem occasionally to be influenced by their acquired habits, as well as by
their sensibility to heat: for the roots of potatoes, onions, &c. will
ergminate with much less heat in the spring than in the autumn; as is
easily observable where these roots are stored for use; and hence malt
is best made in the spring. 2d. The grains and roots brought from more
southern latitudes germinate here sooner than those which are brought
from more northern ones, owing to their acquired habits. Fordyce on
Agriculture. 3d. It was observed by one of the scholars of Linneus,
that the apple-trees sent from hence to New England blossomed for
"Breathe, gentle AIR! from cherub-lips impart
"Thy balmy influence to my anguifh'd heart; 324
"Thou, whose soft voice calls forth the tender blooms,
"Whose pencil paints them, and whose breath perfumes;
"O chafe the Fiend of frost, with leaden mace
"Who seals in death-like sleep my hapless race;
"Melt his hard heart, release his iron hand,
"And give my ivory petals to expand.
"So may each bud, that decks the brow of spring,
"Shed all its incense on thy wafting wing!"—
To her fond prayer propitious Zephyr yields,
Sweeps on his fliding shell through azure fields,
O'er her fair mansion waves his whispering wand,
And gives her ivory petals to expand;
Gives with new life her filial train to rise,
And hail with kindling smiles the genial skies,

few years too early for that climate, and bore no fruit; but afterwards learnt to accommodate themselves to their new situation. (Kalma's Travels.) 4th. The parts of animals become more fenfible to heat after having been previously exposed to cold, as our hands glow on coming into the house after having held snow in them; this seems to happen to vegetables; for vines in grape-houses, which have been exposed to the winter's cold, will become forward and more vigorous than those which have been kept during the winter in the house. (Kenedy on Gardening.) This accounts for the very rapid vegetation in the northern latitudes after the solution of the fnows.

The increafe of the irritability of plants in refpect to heat, after having been previously exposed to cold, is further illuftrated by an experiment of Dr. Walker's. He cut apertures into a birch-tree at different heights; and on the 26th of March some of the apertures bled, or oozed with the sap-juice, when the thermometer was at 39; which same apertures did not bleed on the 13th of March, when the thermometer was at 44. The reafon of this I apprehend was, because on the night of the 25th the thermometer was as low as 34; whereas on the night of the 12th it was at 41; though the ingenious author ascribes it to another caufe. Tranf, of Royal Soc. of Edinburgh, v. 1. p. 19.
So shines the Nymph in beauty’s blushing pride,
When Zephyr wafts her deep calath aside:
Tears with rude kiss her bosom’s gauzy veil,
And flings the fluttering kerchief to the gale.
So bright, the folding canopy undrawn,
Glides the gilt Landau o’er the velvet lawn,
Of beaux and belles displays the glittering throng;
And soft airs fan them, as they roll along.

Where frowning Snowden bends his dizzy brow
O’er Conway, listening to the surge below;
Retiring Lichen climbs the topmost stone,
And ’mid the airy ocean dwells alone.—
Bright shine the stars unnumber’d o’er her head,
And the cold moon-beam gilds her flinty bed;
While round the rifted rocks hoarse whirlwinds breathe,
And dark with thunder fail the clouds beneath.—
The steepy path her plighted swain pursues,
And tracks her light step o’er th’ imprinted dews,
Delighted Hymen gives his torch to blaze,
Winds round the craggs, and lights the mazy ways;
Sheds o’er their secret vows his influence chaste,
And decks with roses the admiring waste.

High in the front of heaven when Sirius glares,
And o’er Britannia shakes his fiery hairs;

Lichen. I. 349. Calcareum, Liver-wort. Clandestine Marriage. This plant is the first that vegetates on naked rocks, covering them with a kind of tapestry, and draws its nourishment perhaps chiefly from the air; after it perishes, earth enough is left for other mosses to root, themselves; and after some ages a foil is produced sufficient for the growth of more succulent and large vegetables. In this manner perhaps the whole earth has been gradually covered with vegetation, after it was raised out of the primeval ocean by subterraneous fires.
When no soft shower descends, no dew distils,
Her wave-worn channels dry, and mute her rills;
When droops her sickening herb, the blossom fades,
And parch'd earth gapes beneath the withering glades.

——With languid step fair Dypsacus retreats;
“Fall gentle dews!” the fainting nymph repeats;
Seeks the low dell, and in the sultry shade
Invokes in vain the Naiads to her aid.—

Four silvan youths in crystal goblets bear
The untailed treasures to the grateful fair;
Pleased from their hands with modest grace the lips,
And the cool wave reflects her coral lips.

With nice selection modest Rubia blends
Her vermil dyes, and 'er the cauldron bends;

_Dypsis_ l. 367. Teasel. One female, and four males. There is a cup around every joint of the stem of this plant, which contains from a spoonful to half a pint of water; and serves both for the nutriment of the plant in dry seasons, and to prevent insects from creeping up to devour its seed. See Silene. The Tyllandia, or wild pine, of the West-Indies has every leaf terminated near the stalk with a hollow bucket, which contains from half a pint to a quart of water. Dampier’s Voyage to Campeachy. Dr. Sloane mentions one kind of aloe furnished with leaves, which, like the wild pine and Banana, hold water; and thence afford necessary refreshment to travellers in hot countries. Nepenthes had a bucket for the same purpose at the end of every leaf. Burn. Zeyl. 42. 17.

_Rubia_ l. 375. Madder. Four males and one female. This plant is cultivated in very large quantities for dying red. If mixed with the food of young pigs or chickens, it colours their bones red. If they are fed alternate fortnights with a mixture of madder, and with their usual food alone, their bones will consist of concentric circles of white and red. Belchier. Phil. Transf. 1736. Animals fed with madder for the purpose of these experiments were found upon dissection to have thinner gall. Comment. de rebus. Lippsae. This circumstance is worth further attention. The colouring materials of vegetables, like those which serve the
Warm 'mid the rising steam the Beauty glows,
As blusses in a mist the dewy rose.
With chemic art four favour'd youths aloof
Stain the white fleece, or stretch the tinted woof;
O'er Age's cheek the warmth of youth diffuse,
Or deck the pale-eyed nymph in roseate hues.
So when Medea to exulting Greece
From plunder'd Colchis bore the golden fleece;
On the loud shore a magic pile she rais'd,
The cauldron bubbled, and the faggots blaz'd;
Pleased on the boiling wave old Aeson swims,
And feels new vigour stretch his swelling limbs;

purpose of tanning, varnishing, and the various medical purposes, do
not seem essential to the life of the plant; but seem given it as a de-
Fence against the depredations of insects or other animals, to whom
these materials are nauseous or deleterious. To insects and many
smaller animals their colours contribute to conceal them from the larger
ones which prey upon them. Caterpillars which feed on leaves are ge-
nerally green; and earth-worms the colour of the earth which they in-
habit; Butter-flies, which frequent flowers, are coloured like them;
small birds which frequent hedges have greenish backs like the leaves,
and light coloured bellies like the sky, and are hence less visible to the
hawk, who passes under them or over them. Those birds which are
much amongst flowers, as the gold-finch (Fringilla carduelis), are fur-
nished with vivid colours. The lark, partridge, hare, are the colour
of the dry vegetables or earth on which they rest. And frogs vary their
colour with the mud of the streams which they frequent; and those
which live on trees are green. Fish, which are generally suspended in
water, and swallows, which are generally suspended in air, have their
backs the colour of the distant ground, and their bellies of the sky. In
the colder climates many of these become white during the existence of
the snows. Hence there is apparent design in the colours of animals,
whilst those of vegetables seem consequent to the other properties of
the materials which possess them.

Pleased on the boiling wave. I. 387. The story of Aeson becoming young
from the medicated bath of Medea, seems to have been intended to
Through his thrill'd nerves forgotten ardors dart,
And warmer eddies circle round his heart;
With softer fires his kindling eye-balls glow,
And darker treffes wanton round his brow.

As dash the waves on India's breezy strand,
Her flush'd cheek press'd upon her lily hand,
Vallisner fits, up-turns her tearful eyes,
Calls her lost lover, and upbraids the skies;

Teach the efficacy of warm bathing in retarding the progress of old age. The words relaxation and bracing, which are generally thought expressive of the effects of warm and cold bathing, are mechanical terms, properly applied to drums or strings; but are only metaphors when applied to the effects of cold or warm bathing on animal bodies. The immediate cause of old age seems to reside in the inirritability of the finer vessels or parts of our system; hence these cease to act, and collapse or become bony or bony. The warm bath is peculiarly adapted to prevent these circumstances by its increasing our irritability, and by moistening and softening the skin, and the extremities of the finer vessels, which terminate in it. To those who are past the meridian of life, and have dry skins, and begin to be emaciated, the warm bath, for half an hour twice a week, I believe to be eminently serviceable in retarding the advances of age.

Vallisneria, l. 395. This extraordinary plant is of the class Two Housés. It is found in the East Indies, in Norway, and various parts of Italy. Lin. Spec. Plant. They have their roots at the bottom of the Rhone, the flowers of the female plant float on the surface of the water, and are furnished with an elastic spiral stalk, which extends or contracts as the water rises and falls; this rise or fall, from the rapid descent of the river, and the mountain torrents which flow into it, often amounts to many feet in a few hours. The flowers of the male plant are produced under water, and as soon as their farina, or dust, is mature, they detach themselves from the plant, and rise to the surface, continue to flourish, and are wafted by the air, or borne by the currents to the female flowers. In this resembling those tribes of insects, where the males at certain seasons acquire wings, but not the females, as ants, Cocchus, Lampyris, Phalæna, Brumata; Lichanella. These male
For him she breathes the silent sigh, forlorn,
Each setting-day; for him each rising morn.—
"Bright orbs, that light yon high ethereal plain,
"Or bathe your radiant tresses in the main;
"Pale moon, that silver'd o'er night's sable brow;
"For ye were witnes to his parting vow!—
"Ye shelving rocks, dark waves, and founding shore,—
"Ye echoed sweet the tender words he swore!—
"Can stars or feas the fails of love retain?
"O guide my wanderer to my arms again!"—

Her buoyant skiff intrepid Ulva guides,
And seeks her Lord amid the trackless tides;

flowers are in such numbers, though very minute, as frequently to cover the surface of the river to considerable extent. See Families of Plants translated from Linneus, p. 677.

Ulva, l. 407. Clandestine marriage. This kind of sea-weed is buoyed up by bladders of air, which are formed in the duplicatures of its leaves; and forms immense floating fields of vegetation; the young ones, branching out from the larger ones, and borne on similar little air-veffels. It is also found in the warm baths of Patavia; where the leaves are formed into curious cells or labyrinths for the purpose of floating on the water. See ulva labyrinthi-formis Lin. Spec. Plant. The air contained in these cells was found by Dr. Priestley to be sometimes purer than common air, and sometimes less pure; the air bladders of fish seem to be similar organs, and serve to render them buoyant in the water. In some of these, as in the Cod and Haddock, a red membrane, consisting of a great number of leaves or duplicatures, is found within the air-bag, which probably secretes this air from the blood of the animal. (Monro, Physiol. of Fish. p. 28.) To determine whether this air, when first separated from the blood of the animal or the plant, be dephlogisticated air, is worthy inquiry. The bladder-fena (Colutea), and bladder-nut (Staphylaxa), have their feed-veffels diffended with air; the Ketmia has the upper joint of the stem immediately under the receptacle of the flower much diffended with air; these seem to be analogous to the air-veffel at the broad end of the egg, and may probably become less pure as the seed ripens: some, which I tried, had the purity of the surround-
Her secret vows the Cyprian Queen approves,  
And hovering halcyons guard her infant-loves;  
Each in his floating cradle round they throng,  
And dimpling Ocean bears the fleet along.—

D 2

ing atmosphere. The air at the broad end of the egg is probably an organ serving the purpose of respiration to the young chick, some of whose vessels are spread upon it like a placenta, or permeate it. Many are of opinion that even the placenta of the human fetus, and cotyledons of quadrupeds, are respiratory organs rather than nutritious ones.

The air in the hollow stems of grasses, and of some umbelliferous plants, bears analogy to the air in the quills, and in some of the bones of birds; supplying the place of the pith, which shrivels up after it has performed its office of protruding the young stem or feather. Some of these cavities of the bones are said to communicate with the lungs in birds. Phil. Trans.

The air-bladders of fish are nicely adapted to their intended purpose; for though they render them buoyant near the surface without the labour of using their fins, yet, when they rest at greater depths, they are no inconvenience, as the increased pressure of the water condenses the air which they contain into less space. Thus, if a cork or bladder of air was immerged a very great depth in the ocean, it would be so much compressed, as to become specifically as heavy as the water, and would remain there. It is probable the unfortunate Mr. Day, who was drowned in a diving-ship of his own construction, misjudged from not attending to this circumstance: it is probable the quantity of air he took down with him, if he descended much lower than he expected, was condened into so small a space as not to render the ship buoyant when he endeavoured to ascend.

M. Hubert made some observations on the air contained in the cavities of the bamboo. The stems of these canes were from 40 to 50 feet in height, and 4 or 5 inches in diameter, and might contain about 30 pints of elastic air. He cut a bamboo, and introduced a lighted candle into the cavity, which was extinguished immediately on its entrance. He tried this about 60 times in a cavity of the bamboo, containing about two pints. He introduced mice at different times into these cavities, which seemed to be somewhat affected, but soon recovered their agility. The stem of the bamboo is not hollow till it rises more than one foot from the earth; the divisions between the cavities are convex downwards. Obsér. fur la Physique par M. Rozier, l. 33. p. 130.
Thus o'er the waves, which gently bend and swell,
Fair Galatea steers her silver shell;
Her playful Dolphins stretch the silken rein,
Hear her sweet voice, and glide along the main.
As round the wild meandering coast she moves
By gushing rills, rude cliffs, and nodding groves;
Each by her pine the Wood-nymphs wave their locks,
And wondering Naiads peep amid the rocks;
Pleased trains of Mermaids rise from coral cells,
Admiring Tritons found their twisted shells;
Charm'd o'er the car pursuing Cupids sweep,
Their snow-white pinions twinkling in the deep;
And, as the lustre of her eye she turns,
Soft sighs the Gale, and amorous Ocean burns.

On Dove's green brink the fair Tremella flood,
And view'd her playful image in the flood;

Tremella. I. 427. Clandestine marriage. I have frequently observed fungusses to this Genus on old rails and on the ground to become a transparent jelly, after they had been frozen in autumnal mornings; which is a curious property, and distinguishes them from some other vegetable mucilage; for I have observed that the paste, made by boiling wheat-flour in water, ceases to be adhesive after having been frozen. I suspected that the Tremella Noftoc, or flar-jelly, also had been thus produced; but have since been well informed, that the Tremella Noftoc is a mucilage voided by Herons after they have eaten frogs; hence it has the appearance of having been pressed through a hole; and limbs of frogs are said sometimes to be found amongst it; it is always seen upon plains or by the sides of water, places which Herons generally frequent.

Some of the Fungusses are so acrid, that a drop of their juice blisters the tongue; others intoxicate those who eat them. The Ofliacks in Siberia ufe them for the latter purpofe; one Fungus of the species, Agarius muscarum, eaten raw; or the decoction of three of them, produces intoxication for 12 or 16 hours. History of Russia. V. I. Nichols. 1780. As all acrid plants become less so, if exposed to a boiling heat, it is probable the common mushroom may sometimes disagree from be-
To each rude rock, lone dell, and echoing grove
Sung the sweet sorrows of her secret love.

"Oh, stay!—return!"—along the sounding shore
Cry'd the sad Naiads,—he return'd no more!—

Now girt with clouds the fallen Evening frown'd,
And withering Eurus swept along the ground;
The misty moon withdrew her horned light,
And sunk with Hesper in the skirt of night;

No dim electric streams, (the northern dawn,) 435
With meek effulgence quiver'd o'er the lawn;

No fair benignant shot one transient ray
To guide or light the wanderer on her way.

Round the dark craggs the murmuring whirlwinds blow,
Woods groan above, and waters roar below;
As o'er the steep's with pausing foot she moves,
The pitying Dryads shriek amid their groves;
She flies,—she stops,—she pants,—she looks behind,

And hears a demon howl in every wind,

—As the bleak blast unfurls her fluttering vest,
Cold beats the snow upon her shuddering breast;
Through her numb'd limbs the chill sensations dart,
And the keen ice-bolt trembles at her heart. 450

ing not sufficiently stewed. The Oflacks blister their skin by a fungus found on Birch-trees; and use the Agaricus officin. for Soap. ib.

There was a dispute whether the fungusses should be classed in the animal or vegetable department. Their animal tase in cookery, and their animal smell when burnt, together with their tendency to putrefaction, insomuch that the Phallus impudicus has gained the name of flink-horn; and lastly, their growing and continuing healthy without light, as the Lioerperdon tuber or truffle, and the fungus vinosus or mucor in dark cellars, and the esculent mushrooms on beds covered thick with straw, would seem to shew that they approach towards the animals, or make a kind of isthmus connecting the two mighty kingdoms of animal and of vegetable nature.
"I sink, I fall! oh, help me, help!" she cries,
Her stiffening tongue th' unfinish'd sound denies;
Tear after tear adown her cheek succeeds,
And pearls of ice beftrew the glittering meads;
Congealing snows her lingering feet surround,
Arrest her flight, and root her to the ground;
With suppliant arms she pours the silent prayer;
Her suppliant arms hang crystal in the air;
Pellucid films her shivering neck o'erspread,
Seal her mute lips, and silver o'er her head,
Veil her pale bosom, glaze her lifted hands,
And shrined in ice the beauteous statute stands.

—Dove's azure nymphs on each revolving year
For fair Tremella shed the tender tear;
With rush-wove crowns in sad procession move,
And found the forrowin shell to hapless love.

Here paus'd the Muse,—across the darken'd pole
Sail the dim clouds, the echoing thunders roll;
The trembling Wood-nymphs, as the tempest lowers,
Lead the gay Goddess to their inmost bowers;
Hang the mute lyre the laurel shade beneath,
And round her temples bind the myrtle wreath.

—Now the light swallow with her airy brood
Skims the green meadow, and the dimpled flood;
Loud shrieks the lone thrush from his leafless thorn,
Th' alarmed beetle sounds his bugle horn;
Each pendant spider winds with fingers fine
His ravel'd cluc, and climbs along the line;
Gay Gnomes in glittering circles stand aloof
Beneath a spreading mushroom's fretted roof;
Swift bees returning seek their waxen cells,
And Sylphs cling quivering in the lily's bells.
Through the still air descend the genial flowers,
And pearly rain-drops deck the laughing flowers.
Bookfeller. Your verses, Mr. Botanist, consist of pure description, I hope there is sense in the notes.

Poet. I am only a flower-painter, or occasionally attempt a landscape; and leave the human figure with the subjects of history to abler artists.

B. It is well known what subjects are within the limits of your pencil; many have failed of success from the want of this self-knowledge. But pray tell me, what is the essential difference between Poetry and Prose? is it solely the melody or measure of the language?

P. I think not solely; for some prose has its melody, and even measure. And good verses, well spoken in a language unknown to the hearer, are not easily to be distinguished from good prose.

B. Is it the sublimity, beauty, or novelty of the sentiments?

P. Not so; for sublime sentiments are often better expressed in prose. Thus when Warwick, in one of the
plays of Shakespeare, is left wounded on the field after the loss of the battle, and his friend says to him, "Oh, could you but fly!" what can be more sublime than his answer, "Why then, I would not fly." No measure of verse, I imagine, could add dignity to this sentiment. And it would be easy to select examples of the beautiful or new from prose writers, which I suppose no measure of verse could improve.

B. In what then consists the essential difference between Poetry and Prose?

P. Next to the measure of the language, the principal distinction appears to me to consist in this: that Poetry admits of but few words expressive of very abstracted ideas, whereas Prose abounds with them. And as our ideas derived from visible objects are more distinct than those derived from the objects of our other senses, the words expressive of these ideas belonging to vision make up the principal part of poetic language. That is, the Poet writes principally to the eye, the Prose-writer uses more abstracted terms. Mr. Pope has written a bad verse in the Windsor Forest:

"And Kennet swift for silver Eels renown'd."

The word renown'd does not present the idea of a visible object to the mind, and is thence prosaic. But change this line thus,

"And Kennet swift, where silver Graylings play."

and it becomes poetry, because the scenery is then brought before the eye.
B. This may be done in prose.

P. And when it is done in a single word, it animates the prose; so it is more agreeable to read in Mr. Gibbon's History, "Germany was at this time overshadowed with extensive forests;" than Germany was at this time full of extensive forests. But where this mode of expression occurs too frequently, the prose approaches to poetry: and in graver works, where we expect to be instructed rather than amused, it becomes tedious and impertinent. Some parts of Mr. Burke's eloquent orations become intricate and enervated by superfluity of poetic ornament; which quantity of ornament would have been agreeable in a poem, where much ornament is expected.

B. Is then the office of Poetry only to amuse?

P. The Muses are young ladies, we expect to see them dressed; though not like some modern beauties with so much gauze and feather, that "the Lady herself is the least part of her." There are however didactic pieces of poetry, which are much admired, as the Georgics of Virgil, Mason's English Garden, Hayley's Epistles; nevertheless Science is best delivered in Prose, as its mode of reasoning is from stricter analogies than metaphors or similes.

B. Do not Personifications and Allegories distinguish Poetry?

P. These are other arts of bringing objects before the eye; or of expressing sentiments in the language of vi-
fion; and are indeed better suited to the pen than the pencil.

B. That is strange, when you have just said they are used to bring their objects before the eye.

P. In Poetry the personification or allegoric figure is generally indistinct, and therefore does not strike us so forcibly as to make us attend to its improbability; but in painting, the figures being all much more distinct, their improbability becomes apparent, and seizes our attention to it. Thus the person of Concealment is very indistinct, and therefore does not compel us to attend to its improbability, in the following beautiful lines of Shakespeare:

"—— She never told her love;
But let Concealment, like a worm i’ th’ bud,
Feed on her damask cheek."——

But in the following lines the person of Reason obtrudes itself into our company, and becomes disagreeable by its distinctness, and consequent improbability.

"To Reason I flew, and intreated her aid,
Who paused on my case, and each circumstance weigh’d;
Then gravely reply’d, in return to my prayer,
That Hebe was fairest of all that were fair.
That’s a truth, reply’d I, I’ve no need to be taught,
I came to you, Reason, to find out a fault.
If that’s all, says Reason, return as you came,
To find fault with Hebe would forfeit my name."
Allegoric figures are on this account in general less manageable in painting and in statuary than in poetry; and can seldom be introduced in the two former arts in company with natural figures, as is evident from the ridiculous effect of many of the paintings of Rubens in the Luxemburgh gallery; and for this reason, because their improbability becomes more striking, when there are the figures of real persons by their side to compare them with.

Mrs. Angelica Kauffman, well apprised of this circumstance, has introduced no mortal figures amongst her Cupids and her Graces. And the great Roubiliac, in his unrivalled monument of Time and Fame struggling for the trophy of General Fleming, has only hung up a medallion of the head of the hero of the piece. There are however some allegoric figures, which we have so often heard described or seen delineated, that we almost forget that they do not exist in common life; and hence view them without astonishment; as the figures of the heathen mythology, of angels, devils, death and time; and almost believe them to be realities, even when they are mixed with representations, of the natural forms of man. Whence I conclude, that a certain degree of probability is necessary to prevent us from revolting with distaste from unnatural images; unless we are otherwise so much interested in the contemplation of them as not to perceive their improbability.

B. Is this reasoning about degrees of probability just?—When Sir Joshua Reynolds, who is unequalled both in the theory and practice of his art, and who is a great master of the pen as well as the pencil, has asserted in a
discourse delivered to the Royal Academy, December 11, 1786, that "the higher styles of painting, like the higher kinds of the Drama, do not aim at any thing like deception; or have any expectation, that the spectators should think the events there represented as really passing before them." And he then accuses Mr. Fielding of bad judgment, when he attempts to compliment Mr. Garrick in one of his novels, by introducing an ignorant man, mistaking the representation of a scene in Hamlet for a reality; and thinks, because he was an ignorant man, he was liable to make such a mistake.

P. It is a metaphysical question, and requires more attention than Sir Joshua has bestowed upon it.—You will allow, that we are perfectly deceived in our dreams; and that even in our waking reveries, we are often so much absorbed in the contemplation of what passes in our imaginations, that for a while we do not attend to the lapse of time or to our own locality; and thus suffer a similar kind of deception as in our dreams. That is, we believe things present before our eyes, which are not so.

There are two circumstances, which contribute to this complete deception in our dreams. First, because in sleep the organs of sense are closed or inert, and hence, the trains of ideas associated in our imaginations are never interrupted or dissolved by the irritations of external objects, and cannot therefore be contrasted with our sensations. On this account, though we are affected with a variety of passions in our dreams, as anger, love, joy; yet we never experience surprise.—For surprise is only produced when any external irritations suddenly obtrude themselves, and dissolve our passing trains of ideas.

Secondly, because in sleep there is a total suspension of our voluntary power, both over the muscles of our bodies,
and the ideas of our minds; for we neither walk about, nor reason in complete sleep. Hence, as the trains of ideas are passing in our imaginations in dreams, we cannot compare them with our previous knowledge of things, as we do in our waking hours; for this is a voluntary exertion; and thus we cannot perceive their incongruity.

Thus we are deprived in sleep of the only two means by which we can distinguish the trains of ideas passing in our imaginations, from those excited by our sensations; and are led by their vivacity to believe them to belong to the latter. For the vivacity of these trains of ideas, passing in the imagination, is greatly increased by the causes above-mentioned; that is, by their not being disturbed or dislodged either by the appulses of external bodies, as in surprise; or by our voluntary exertions in comparing them with our previous knowledge of things, as in reasoning upon them.

B. Now to apply.

P. When by the art of the Painter or Poet a train of ideas is suggested to our imaginations, which interests us so much by the pain or pleasure it affords, that we cease to attend to the irritations of common external objects, and cease also to use any voluntary efforts to compare these interesting trains of ideas with our previous knowledge of things, a complete reverie is produced: during which time, however short, if it be but for a moment, the objects themselves appear to exist before us. This, I think, has been called by an ingenious critic "the ideal presence" of such objects. (Elements of Criticism by Lord Kames). And in respect to the compliment intended by Mr. Fielding to Mr. Garrick, it would seem that an ignorant Rustic at the play of Hamlet, who has
some previous belief in the appearance of Ghofts would sooner be liable to fall into reverie, and continue in it longer, than one who possessed more knowledge of the real nature of things, and had a greater facility of exercising his reason.

B. It must require great art in the Painter or Poet to produce this kind of deception?

P. The matter must be interesting from its sublimity, beauty, or novelty; this is the scientific part; and the art consists in bringing these distinctly before the eye, so as to produce (as above-mentioned) the ideal presence of the object, in which the great Shakespeare particularly excels.

B. Then it is not of any consequence whether the representations correspond with nature?

P. Not if they so much interest the reader or spectator as to induce the reverie above described. Nature may be seen in the market-place, or at the card-table; but we expect something more than this in the play-house or picture-room. The further the artist recedes from nature, the greater novelty he is likely to produce; if he rises above nature, he produces the sublime; and beauty is probably a selection and new combination of her most agreeable parts. Yourself will be sensible of the truth of this doctrine by recollecting over in your mind the works of three of our celebrated artists. Sir Joshua Reynolds has introduced sublimity even into its portraits; we admire the representation of persons, whose reality we should have passed by unnoticed. Mrs. Angelica Kauffman at-
tracts our eyes with beauty, which I suppose nowhere else; certainly few Grecian faces are seen in this country. And the daring pencil of Fuseli transports us beyond the boundaries of nature, and ravishes us with the charm of the most interesting novelty. And Shakespeare, who excels in all these together, so far captivates the spectator, as to make him unmindful of every kind of violation of Time, Place, or Existence. As at the first appearance of the Ghost of Hamlet, "his ear must be dull as the fat weed, which roots itself on Lethe's brink;" who can attend to the improbability of the exhibition? So in many scenes of the Tempest we perpetually believe the action passing before our eyes, and relapse with somewhat of distaste into common life at the intervals of the representation.

B. I suppose a poet of less ability would find such great machinery difficult and cumbrous to manage?

P. Just so, we should be shocked at the apparent improbabilities. As in the gardens of a Sicilian nobleman, described in Mr. Brydone's and in Mr. Swinburn's travels, there are said to be six hundred statues of imaginary monsters, which so disquiet the spectators, that the state had once a serious design of destroying them; and yet the very improbable monsters in Ovid's Metamorphoses have entertained the world for many centuries.

B. The monsters in your Botanic Garden, I hope, are of the latter kind?

P. The candid reader must determine.
AGAIN the Goddes strikes the golden lyre,
And tunes to wilder notes the warbling wire;
With soft suspended step Attention moves,
And Silence hovers o'er the listening groves;
Orb within orb the charmed audience throng,
And the green vault reverberates the song.

"Breathe soft, ye Gales!" the fair CARLINA cries,
"Bear on broad wings your Votress to the skies.

Carlina. 1. 7: Carline Thistle. Of the clafs Confederate Males. The seeds of this and of many other plants of the same clafs are furnifhed with a plume, by which admirable mechanism they perform long aerial journeys, crossing lakes and deserts, and are thus disseminated far from the original plant, and have much the appearance of a Shuttlecock as they fly. The wings are of different construction, some being like a divergent tuft of hair, others are branched like feathers, some are cle-
"How sweetly mutable you orient hues,
As Morn's fair hand her opening roses strews;
How bright, when Iris blending many a ray
Binds in embroider'd wreath the brow of Day;
Soft, when the pendant Moon with lustres pale
O'er heaven's blue arch unfurls her milky veil;
While from the north long threads of silver light
Dart on swift shuttles o'er the tissued night!
Breathe soft, ye Zephyrs! hear my fervent sighs,
Bear on broad wings your Votress to the skies!"
—Plume over plume in long divergent lines
On whale-bone ribs the fair Mechanic joins;
Inlays with eider down the silken strings,
And waves in wide expanse Dædalian wings;
Round her bold sons the waving pennons binds,
And walks with angel-step upon the winds.

So on the shoreless air the intrepid Gaul
Launch'd the vast concave of his buoyant ball.—

vated from the crown of the feed by a slender foot-flalk, which gives
them a very elegant appearance, others fit immediately on the crown
of the feed.

Nature has many other curious vegetable contrivances for the dispersiveation of seeds; see note on Helianthus. But perhaps none of them has
more the appearance of design than the admirable apparatus of Tilland sia for this purpose. This plant grows on the branches of trees, like the
milleto, and never on the ground; the seeds are furnished with many
long threads on their crowns; which, as they are driven forwards by
the winds, wrap round the arms of trees, and thus hold them fast till
they vegetate. This is very analogous to the migration of Spiders on
the gossamer, who are said to attach themselves to the end of a long
thread, and rise thus to the tops of trees or buildings, as the accidental
breezes carry them.
Journeying on high, the silken castle glides
Bright as a meteor through the azure tides;
O'er towns and towers and temples wins its way,
Or mounts sublime, and gilds the vault of day.
Silent with upturn'd eyes unbreathing crowds
Pursue the floating wonder to the clouds;
And flush'd with transport or benumb'd with fear,
Watch, as it rises, the diminish'd sphere.
—Now less and less!—and now a speck is seen!—
And now the fleeting rack obtrudes between!—
With bended knees, raised arms, and suppliant brow
To every shrine with mingled cries they vow.—
"Save Him, ye Saints! who o'er the good preside;
"Bear him, ye Winds! ye Stars benignant! guide."
—The calm Philosopher in ether fails,
Views broader stars, and breathes in purer gales;
Sees, like a map, in many a waving line
Round Earth's blue plains her lucid waters shine;
Sees at his feet the forky lightnings glow,
And hears innocuous thunders roar below.
—Rise, great MONGOLFIER! urge thy venturous flight
High o'er the Moon's pale ice-reflected light;
High o'er the pearly Star, whose beamy horn
Hangs in the east, gay harbinger of morn;
Leave the red eye of Mars on rapid wing,
Jove's silver guards, and Saturn's dusky ring;
Leave the fair beams, which, issuing from afar,
Play with new lustres round the Georgian star;
Shun with strong oars the Sun's attractive throne,
The sparkling zodiac, and the milky zone;
Where headlong Comets with increasing force
Through other systems bend their blazing course.—
For thee Calliope her chair withdraws,
For thee the Bear retracts his shaggy paws;
High o'er the North thy golden orb shall roll,
And blaze eternal round the wondering pole.
So Argo, rising from the southern main,
Lights with new stars the blue ethereal plain;
With favouring beams the mariner protects,
And the bold course, which first it steer'd, directs.

Inventrefs of the Woof, fair Lina flings
The flying shuttle through the dancing strings;
In lays the broder'd weft with flowery dyes,
Quick beat the reeds, the pedals fall and rise;
Slow from the beam the lengths of warp unwind,
And dance and nod the mafly weights behind.

Taught by her labours, from the fertile soil
Immortal Isis clothed the banks of Nile;
And fair Arachne with her rival loom
Found undeserved a melancholy doom.—

Five Sister-nymphs with dewy fingers twine
The beamy flax, and stretch the fibre-line;
Quick eddying threads from rapid spindles reel,
Or whirl with beaten foot the dizzy wheel.

For thee the Bear. I. 60. Tibi jam brachia contrahit ardens Scorpius.
Herschel's Construcfion of the Heavens. Phil. Trans. V. 75. p. 266.

Linum. I. 67. Flax. Five males and five females. It was first found
on the banks of the Nile. The Linum Lusitanicum, or Portugal flax,
has ten males: see the note on Curcuma. Isis was said to invent spin-
ing and weaving: mankind before that time were clothed with the
skins of animals. The fable of Arachne was to compliment this new
art of spinning and weaving, supposed to surpass in fineness the web of
the Spider.
Charm'd round the busy Fair five shepherds press,
Praise the nice texture of their snowy dress,
Admire the Artists, and the art approve,
And tell with honey'd words the tale of love.

So now, where Derwent rolls his dusky floods
Through vaulted mountains, and a night of woods,
The Nymph, Gossypia, treads the velvet sod,
And warms with rosy smiles the watery God;

Gossypia. 1. 87. Gossypium. The cotton plant. On the River Derwent near Matlock in Derbyshire, Sir Richard Arkwright has erected his curious and magnificent machinery for spinning cotton; which had been in vain attempted by many ingenious artists before him. The cotton-wool is first picked from the pods and seeds by women. It is then carded by cylindrical cards, which move against each other, with different velocities. It is taken from these by an iron-hand or comb, which has a motion similar to that of scratching, and takes the wool off the cards longitudinally in respect to the fibres or staple, producing a continued line loosely cohering, called the Rove or Roving. This Rove, yet very loosely twisted, is then received or drawn into a whirling Calvinter, and is rolled by the centrifugal force in spiral lines within it; being yet too tender for the spindle. It is then passed between two pairs of rollers; the second pair moving faster than the first elongate the thread with greater equality than can be done by the hand; and is then twisted on spoles or bobbins.

The great fertility of the Cotton-plant in these fine flexible threads, whilst those from Flax, Hemp, and Nettles, or from the bark of the Mulberry-tree, require a previous putrefaction of the parenchymatous substance, and much mechanical labour, and afterwards bleaching, renders this plant of great importance to the world. And since Sir Richard Arkwright's ingenious machine has not only greatly abbreviated and simplified the labour and art of carding and spinning the Cotton-wool, but performs both these circumstances better than can be done by hand, it is probable, that the clothing of this small feed will become the principal clothing of mankind; though animal wool and silk may be preferable in colder climates, as they are more imperfect conductors of heat, and are thence a warmer clothing.
His ponderous oars to slender spindles turns,
And pours o'er massy wheels his foamy urns;
With playful charms her hoary lover wins,
And wields his trident,—while the Monarch spins.
—First with nice eye emerging Naiads curl
From leathery pods the vegetable wool;
With wiry teeth revolving cards release
The tangled knots, and smooth the ravel'd fleece;
Next moves the iron-hand with fingers fine,
Combs the wide card, and forms the eternal line;
Slow, with soft lips, the whirling Can acquires
The tender skeins, and wraps in rising spires;
With quicken'd pace successive rollers move,
And these retain, and those extend the rove;
Then fly the spoles, the rapid axles glow;
And slowly circumvolves the labouring wheel below.

PAPYRA, throned upon the banks of Nile,
Spread her smooth leaf, and waved her silver style.

emerging Naiads curl
From leathery pods the vegetable wool.

em circum Milesia vellera Nympha
Carpebant, byali satu ro fucata color.

Cyperus. Papyrus. l. 105. Three males, one female. The leaf of this plant was first used for paper, whence the word paper; and leaf, or folium, for a fold of a book. Afterwards the bark of a species of mulberry was used; whence liber signifies a book, and the bark of a tree. Before the invention of letters mankind may be said to have been perpetually in their infancy, as the arts of one age or country generally died with their inventors. Whence arose the policy, which still continues in Indostan, of obliging the son to practice the profession of his father. After the discovery of letters, the facts of Astronomy and Chemistry became recorded in written language, though the ancient hieroglyphic characters for the planets and metals continue in use at this day.
—The storied pyramid, the laurel’d bust,
The trophy’d arch had crumbled into dust;
The sacred symbol, and the epic song,
(Unknown the character, forgot the tongue,) 110
With each unconquer’d chief, or fainted maid,
Sunk undistinguish’d in Oblivion’s shade.
Sad o’er the scatter’d ruins Genius sigh’d,
And infant Arts but learn’d to lisp and died.
Till to astonish’d realms PAPYRA taught
To paint in mystic colours Sound and Thought.
With Wisdom’s voice to print the page sublime,
And mark in adamant the steps of Time.
—Three favour’d youths her soft attention share,
The fond disciples of the studious Fair,
Hear her sweet voice, the golden process prove;
Gaze, as they learn; and, as they listen, love.
The first from Alpha to Omega joins
The letter’d tribes along the level lines;

The antiquity of the invention of music, of astronomical observations, and the manufacture of Gold and Iron, are recorded in Scripture.

About twenty letters, ten cyphers, and seven crotchets, represent by their numerous combinations all our ideas and sensations! the musical characters are probably arrived at their perfection, unless emphasis, and tone, and swell could be expressed, as well as note and time. Charles the Twelfth of Sweden had a design to have introduced a numeration by squares, instead of by decimation, which might have served the purposes of philosophy better than the present mode, which is said to be of Arabic invention. The Alphabet is yet in a very imperfect state; perhaps seventeen letters could express all the simple sounds in the European languages. In China they have not yet learned to divide their words into syllables, and are therefore necessitated to employ many thousand characters; it is said above eighty thousand. It is to be wished, in this ingenious age, that the European nations would accord to reform our alphabet.
Weighs with nice ear the vowel, liquid, sord,  
And breaks in syllables the volant word.
Then forms the next upon the marshald’s plain  
In deepening ranks his dexterous cypher-train;
And counts, as wheel the decimating bands,
The dews of Egypt, or Arabia’s sands.  
And then the third on four concordant lines
Prints the lone crotchet, and the quaver joins;
Mark the gay trill, the solemn pause inscribes,
And parts with bars the undulating tribes.

Pleafed round her cane-wove throne, the applauding crowd
Clap’d their rude hands, their swarthy foreheads bow’d;
With loud acclaim “a present God!” they cry’d,
“A present God!” rebellowing shores reply’d—
Then peal’d at intervals with mingled swell
The echoing harp, shrill clarion, horn, and shell;  
While Bards ecstatic, bending o’er the lyre,
Struck deeper chords, and wing’d the song with fire.
Then mark’d Astronomers with keener eyes
The Moon’s refulgent journey through the skies;
Watch’d the swift Comets urge their blazing cars,  
And weigh’d the Sun with his revolving Stars.
High rais’d the Chemists their Hermetic wands,
(And changing forms obey’d their waving hands,)  
Her treasure’d gold from Earth’s deep chambers tore,
Or fus’d and harden’d her chalybeate ore.

All with bent knee from fair Papyra claim
Wove by her hands the wreath of deathless fame.
—Exulting Genius crown’d his darling child,
The young Arts clasped her knees, and Virtue smil’d.
So now Delany forms her mimic bowers,
Her paper foliage, and her silken flowers;
Her virgin train the tender scissars ply,
Vein the green leaf, the purple petal dye:
Round wiry stems the flaxen tendril bends,
Moss creeps below, and waxen fruit impends.
Cold Winter views amid his realms of snow
Delany's vegetable statues blow;
Smoothes his stern brow, delays his hoary wing,
And eyes with wonder all the blooms of Spring.

The gentle Lapsana, Nymphæa fair,
And bright Calendula with golden hair,

So now Delany. l. 155. Mrs. Delany has finished nine hundred and seventy accurate and elegant representations of different vegetables with the parts of their flowers, fructification, &c. according to the classification of Linneus, in what he terms paper-mosaic. She began this work at the age of 47, when her sight would not longer serve her to paint, in which she much excelled; between her age of 74 and 82, at which time her eyes quite failed her, she executed the curious Hortus ficcus above-mentioned, which I suppose contains a greater number of plants than were ever before drawn from the life by any one person. Her method consisted in placing the leaves of each plant with the petals, and all the other parts of the flowers, on coloured paper, and cutting them with scissors accurately to the natural size and form, and then pasting them on a dark ground; the effect of which is wonderful, and their accuracy less liable to fallacy than drawings. She is at this time (1788) in her 89th year, with all the powers of a fine understanding still unimpaired. I am informed another very ingenious lady, Mrs. North, is constructing a similar Hortus ficcus, or Paper-garden; which she executes on a ground of vellum with such elegant taste and scientific accuracy, that it cannot fail to become a work of inestimable value.

Lapsana, Nymphæa alba, Calendula. l. 165. And many other flowers close and open their petals at certain hours of the day; and thus constitute what Linneus calls the Horologe, or Watch of Flora. He enumerates 46 flowers, which possess this kind of sensibility. I shall men-
Watch with nice eye the Earth's diurnal way,
Marking her solar and sidereal day,
Her flow nutation, and her varying clime,
And trace with mimic art the march of Time;
Round his light foot a magic chain they fling,
And count the quick vibrations of his wing.

First in its brazen cell reluctant roll'd
Bends the dark spring in many a fleely fold;

tion a few of them with their respective hours of rising and setting, as Linneus terms them. He divides them first into meteoric flowers, which less accurately observe the hour of unfolding, but are expanded, sooner or later, according to the cloudiness, moisture, or pressure of the atmosphere. 2d. Tropical flowers open in the morning and close before evening every day; but the hour of the expanding becomes earlier or later, as the length of the day increases or decreases. 3dly. Equinoctial flowers, which open at a certain and exact hour of the day, and for the most part close at another determinate hour.

As these observations were probably made in the botanic gardens at Ujífa, they must require further attention to suit them to our climate. See Stillingsflect's Calendar of Flora.
On spiral brafs is ftretch'd the wiry throng, 175
Tooth urges tooth, and wheel drives wheel along:
In diamond-eyes the polish'd axles flow,
Smooth slides the hand, the balance pants below.
Round the white circlet in relievo bold
A Serpent twines his scaly length in gold; 180
And brightly pencil'd on the enamel'd sphere
Live the fair trophies of the paffing year.

—Here Time's huge fingers grasp his giant-mace,
And dash proud Superftition from her base,
Rend her strong towers and gorgeous fanes, and fhed 185
The crumbling fragments round her guilty head.
There the gay Hours, whom wreath of roses deck,
Lead their young trains amid the cumbrous wreck;
And, slowly purpling o'er the mighty waft,
Plant the fair growths of Science and of Taffe. 190
While each light Moment, as it dances by
With feathery foot and pleasure-twinkling eye,
Feeds from its baby-hand, with many a kifs,
The callow neftlings of domestic Blifs.

As yon gay clouds, which canopy the skies, 195
Change their thin forms, and lofe their lucid dyes;
So the soft bloom of Beauty's vernal charms
Fades in our eyes, and withers in our arms.
—Bright as the silvery plume, or pearly shell,
The snow-white rose, or lily's virgin bell, 200
The fair Helleboras attractive fhone,
Warm'd every Sage, and every Shepherd won.—

Helleborus. l. 201. Many males, many females. The Helleborus niger, or Christmas rofe, has a large beautiful white flower, adorned with a circle of tubular two-lipp'd neftaries. After impregnation the flower undergoes a remarkable change, the neftaries drop off, but the
Round the gay fitters press the *enamour'd bands*,
And seek with soft solicitude their hands.
—Ere while how chang'd!—in dim suffusion lies
The glance divine, that lighten'd in their eyes;
Cold are those lips, where smiles seductive hung,
And the weak accents linger on their tongue;
Each rosetate feature fades to livid green,—
—Disgust with face averted shuts the scene.

So from his gorgeous throne, which awed the world,
The mighty Monarch of the east was hurl'd,
To dwell with brutes beneath the midnight storm,
By Heaven's just vengeance changed in mind and form.
—Prone to the earth He bends his brow superb,
Crops the young floret and the bladed herb;
Lolls his red tongue, and from the reedy side
Of flow Euphrates laps the muddy tide,
Long eagle plumes his arching neck invest,
Steal round his arms, and clasp his sharp'n'd breast;
Dark brinded hairs in bristling ranks, behind,
Rise o'er his back, and ruffle in the wind,
Clothe his lank sides, his shrivel'd limbs surround,
And human hands with talons print the ground.
Silent in shining troops the Courtier-throng
Purse their monarch as he crawls along;

*white corol remains, and gradually becomes quite green. This curious metamorphose of the corol, when the nectaries fall off seems to shew that the white juice of the corol were before carried to the nectaries, for the purpose of producing honey: because when these nectaries fall off, no more of the white juice is secreted in the corol, but it becomes green, and degenerates into a calyx. See note on Lonicera. The nectary of the Tropæolum, garden naflurtion, is a coloured horn growing from the calyx.*
E'en Beauty pleads in vain with smiles and tears,
Nor Flattery's self can pierce his pendant ears.

Two Sifter-Nymphs to Ganges' flowery brink
Bend their light steps, and lucid water drink,
Wind through the dewy rice, and nodding canes,
(As eight black Eunuchs guard the sacred plains),
With playful malice watch the scaly brood,
And shower the inebriate berries on the flood,—
Stay in your crystal chambers, silver tribes!

Turn your bright eyes, and shun the dangerous bribes;
The tramèl'd net with less destruction sweeps
Your curling shallows, and your azure deeps;
With less deceit, the gilded fly beneath,
Lurks the fell hook unseen,—to taste is death!—
—Dim your flow eyes, and dull your pearly coat,
Drunk on the waves your languid forms shall float,
On useless fins in giddy circles play,
And Herons and Otters seize you for their prey.——

So, when the Saint from Padua's graceless land
In silent anguish fought the barren strand,
High on the shatter'd beach sublime He stood,
Still'd with his waving arm the babbling flood;
" To Man's dull ear," He cry'd, " I call in vain,
" Hear me, ye scaly tenants of the main!"
Mis-shapen Seals approach in circling flocks,
In dusky mail the Tortoise climbs the rocks,

Two Sifter-Nymphs. I. 229. Menispernum. Cocculus. Indian berry,
Two houses, twelve males. In the female flower there are two stigmas
and eight filaments without anthers on their summits; which are called
by Linneus eunuchs. See the note on Curcuma. The berry intoxicates
fish. Saint Anthony of Padua, when the people refused to hear him,
preached to the fish, and converted them. Addison's travels in Italy.
Torpedoes, Sharks, Rays, Porpus, Dolphins, pour
Their twinkling squadrons round the glittering shore;
With tangled fins, behind, huge Phoëc glide,
And Whales and Grampi well the distant tide.
Then kneel’d the hoary Seer, to heaven address’d
His fiery eyes, and smote his founders breast;
“Blefs ye the Lord!” with thundering voice he cry’d,
“Blefs ye the Lord!” the bending shores reply’d;
The winds and waters caught the sacred word,
And mingling echoes shout’d “Blefs the Lord!”
The listening shoals the quick contagion feel,
Pant on the floods, inebriate with their zeal,
Ope their wide jaws, and bow their slimy heads,
And dash with frantic fins their foamy beds.

Sopha’d on silk, amid her charm-built towers,
Her meads of asphodel, and amaranth bowers,
Where Sleep and Silence guard the soft abodes,
In full en apathy Papaver nods.
Faint o’er her couch in scintillating streams
Pass the thin forms of Fancy and of Dreams;
Froze by enchantment on the velvet ground
Fair youths and beauteous ladies glitter round;

*Papaver.* I. 270. Poppy. Many males, many females. The plants of this class are almost all of them poisonous; the finest opium is procured by wounding the heads of large poppies with a three-edged knife, and tying muscle-shells to them to catch the drops. In small quantities it exhilarates the mind, raises the passions, and invigorates the body; in large ones it is succeeded by intoxication, languor, stupor and death. It is customary in India for a messenger to travel above a hundred miles without rest or food, except an appropriated bit of opium for himself, and a large one for his horse at certain stages. The emaciated and decrepit appearance, with the ridiculous and idiotic gestures, of the opium-eaters in Constantinople is well described in the Memoirs of Baron de Tott.
On crystal pedestals they seem to fish,
Bend the meek knee, and lift the imploring eye.
—And now the Sorceress bares her shrivel’d hand,
And circles thrice in air her ebon wand;
Flush’d with new life descending statues talk,
The pliant marble softening as they walk;
With deeper sobs reviving lovers breathe,
Fair bosoms rise, and soft hearts pant beneath;
With warmer lips relentless damsels speak,
And kindling blushes tinge the Parian cheek;
To viewless lutes aërial voices sing,
And hovering Loves are heard on rustling wing.
—She waves her wand again!—fresh horrors seize
Their stiffening limbs, their vital currents freeze;
By each cold nymph her marble lover lies,
And iron slumber seals their glassey eyes.
So with his dread Caduceus HERMES led
From the dark regions of the imprison’d dead,
Or drove in silent shoals the lingering train
To Night’s dull shore, and PLUTO’s dreary reign.

So with her waving pencil CREWE commands
The realms of Taste, and Fancy’s fairy lands;
Calls up with magic voice the shapes, that sleep
In earth’s dark bosome, or unfathom’d deep;
That shrined in air on viewless wings aspire,
Or blazing bathe in elemental fire.
As with nice touch her plastic hand the moves,
Rise the fine forms of Beauties, Graces, Loves;

So with her waving pencil. l. 295. Alluding to the many beautiful paintings by Miss EMMA CREWE; to whom the author is indebted for the very elegant Frontispiece, where Flora, at play with Cupid, is loading him with garden-tools.
Kneel to the fair Inchantress, smile or sigh,
And fade or flourish, as she turns her eye.

Fair Cista, rival of the rosy dawn,
Call'd her light choir, and trod the dewy lawn;
Hail'd with rude melody the new-born May,
As cradled yet in April's lap she lay.

I.
"Born in yon blaze of orient sky,
"Sweet May! thy radiant form unfold;
"Unclofe thy blue voluptuous eye,
"And wave thy shadowy locks of gold.

II.
"For Thee the fragrant zephyrs blow,
"For Thee descends the funny shower.

Cista labdanifera. I. 305. Many males, one female. The petals of
this beautiful and fragrant shrub, as well as of the Cenothera, tree prim-
rofe, and others, continue expanded but a few hours, falling off about
noon, or soon after, in hot weather. The most beautiful flowers of
the Caftus grandiflorus (see Cerea) are of equally short duration, but
have their existence in the night. And the flowers of the Hibifcus trifi-
onum are said to continue but a single hour. The courtship between
the males and females in these flowers might be easily watched; the
males are said to approach and recede from the females alternately.
The flowers of the Hibifcus finifis, mutable rose, live in the West In-
dies, their native climate, but one day; but have this remarkable pro-
PERTY, they are white at the first expansion, then change to deep red,
and become purple as they decay.

The gum or resin of this fragrant vegetable is collected from exten-
sive underwoods of it in the East by a singular contrivance. Long lea-
ther thongs are tied to poles and cords, and drawn over the tops of
these shrubs about noon; which thus collect the dust of the anthers,
which adheres to the leather, and is occasionally scraped off. Thus in
some degree is the manner imitated, in which the bee collects on his
thighs and legs the same material for the construction of his combs.
The rills in softer murmurs flow,
And brighter blossoms gem the bower.

III.

Light Graces drest'd in flowery wreaths
And tiptoe Joys their hands combine;
And Love his sweet contagion breathes,
And laughing dances round thy shrine.

IV.

Warm with new life the glittering throngs
On quivering fin and rustling wing
Delighted join their votive songs,
And hail thee, Goddess of the Spring.

O'er the green brinks of Severn's oozy bed,
In changeful rings, her sprightly troop She led;
Pan tripp'd before, where Eudnelf shades the mead,
And blew with glowing lip his sevenfold reed;
Emerging Naiads swell'd the jocund strain,
And aped with mimic step the dancing train.—

"I faint, I fall!"—at noon the Beauty cried,
"Weep o'er my tomb, ye Nymphs!"—and funk and died.

—Thus, when white Winter o'er the shivering clime
Drives the still snow, or showers the silver rime;
As the lone Shepherd o'er the dazzling rocks
Prints his steep step, and guides his vagrant flocks;
Views the green holly veil'd in network nice,
Her vermil clusters twinkling in the ice;

Sevenths reed. 1. 328. The sevenfold reed, with which Pan is frequently described, seems to indicate, that he was the inventor of the musical gamut.
Admires the lucid vales, and lumbering floods,
Fantastic cataracts, and crystal woods,
Transparent towns, with seas of milk between,
And eyes with transport the refulgent scene:
If breaks the sunshine o'er the spangled trees,
Or flits on tepid wing the western breeze,
In liquid dews descends the transient glare,
And all the glittering pageant melts in air.

Where Andes hides his cloud-wreath'd crest in snow,
And roots his bafe on burning sands below;
Cinchona, fairest of Peruvian maids,
To Health's bright Goddes in the breezy glades
On Quito's temperate plain an altar rear'd,
Trill'd the loud hymn, the solemn prayer preferr'd:
Each balmy bud she cull'd, and honey'd flower,
And hung with fragrant wreaths the sacred bower;
Each pearly sea she search'd, and sparkling mine,
And piled their treasures on the gorgeous shrine;
Her suppliant voice for sickening Loxa rais'd,
Sweet breath'd the gale, and bright the cenfer blazed.

"Divine Hygeia! on thy votaries bend
Thy angel-looks, oh, hear us, and defend!
While streaming o'er the night with baleful glare
The star of Autumn rays his misty hair;
Fierce from his fens the Giant Ague springs,
And wrapp'd in fogs descend on vampire wings;
F

Several of these trees were felled for other purposes into a lake, when an epidemic fever of a very mortal kind prevailed at Loxa in Peru, and the woodmen, accidentally drinking the water, were cured; and thus were discovered the virtues of this famous drug.
"Before, with shuddering limbs cold Tremor reels;
And Fever's burning nostril dogs his heels;
Loud claps the grinning Fiend his iron hands,
Stamps with his marble feet, and shouts along the lands;
Withers the damask cheek, unnerves the strong,
And drives with scorpion-lash the shrieking throng.

"Oh, Goddes! on thy kneeling votaries bend
'Thy angel-looks, oh hear us, and defend!"
—Hygeia, leaning from the blest abodes,
The crystal mansions of the immortal gods,
Saw the sad Nymph uplift her dewy eyes,
Spread her white arms, and breathe her fervid sighs;
Call'd to her fair associates, Youth, and Joy,
And shot all-radiant through the glittering sky;
Loose waved behind her golden train of hair,
Her sapphire mantle swam diffus'd in air.—
O'er the grey matted moss, and pansied sod,
With step sublime the glowing Goddess trod,
Gilt with her beamy eye the conscious shade,
And with her smile celestial bless'd the maid.

"Come to my arms," with seraph voice she cries,
"Thy vows are heard, benignant Nymph! arise;
Where yon aspiring trunks fantastic wreath
Their mingled roots, and drink the rill beneath,
Yield to the biting axe thy sacred wood,
And strew the bitter foliage on the flood."

In silent homage bow'd the blushing maid,—
Five youths athletic hasten to her aid,
O'er the scar'd hills re-echoing strokes refound,
And headlong forests thunder on the ground.
Round the dark roots, rent bark, and shatter'd boughs,
From ocherous beds the swelling fountain flows;
With streams austerely its winding margin laves,
And pours from vale to vale its dusky waves.
—As the pale squadrons, bending o'er the brink,
View with a sigh their alter'd forms, and drink;
Slow-ebbing life with refluent crimson breaks
O'er their wan lips, and paints their haggard cheeks;
Through each fine nerve rekindling transports dart,
Light the quick eye, and swell the exulting heart.
—Thus ISRAEL's heaven-taught chief o'er trackless sands
Let to the sultry rock his murmuring bands.
Bright o'er his brows the forked radiance blazed,
And high in air the rod divine He raised.—
Wide yawns the cliff!—amid the thirsty throng
Rush the redundant waves, and shine along;
With gourds and shells and helmets press the bands,
Ope their parch'd lips, and spread their eager hands,
Snatch their pale infants to the exuberant shower,
Kneel on the shattered rock, and bless the Almighty Power.

Bolster'd with down, amid a thousand wants,
Pale Dropfy rears his bloated form, and pants;
"Quench me, ye cool pellucid rills!" he cries,
Wets his parch'd tongue, and rolls his hollow eyes.
So bends tormented TANTALUS to drink,
While from his lips the refluent waters shrink;
Again the rising stream his bosom laves,
And Thirst consumes him 'mid circumfluent waves.
—Divine HYGEIA, from the bending sky
Descending, listen to his piercing cry;
Assumes bright Digitalis' dress and air;

Her ruby cheek, white neck, and raven hair;

Four youths protect her from the circling throng,
And like the Nymph the Goddes steps along.—

—O'er Him She waves her serpent-wreathed wand,
Cheers with her voice, and raises with her hand,
Warms with rekindling bloom his visage wan,
And charms the shapeless monster into man.

So when Contagion with mephitic breath
And wither'd Famine urged the work of death;
Marfeilles' good Bishop, London's generous Mayor,
With food and faith, with medicine and with prayer,

Digitalis. l. 425. Of the class Two Powers. Four males, one female.

Foxglove. The effect of this plant in that kind of Dropfy, which is termed anaesthesia, where the legs and thighs are much swelled, attended with great difficulty of breathing, is truly astonishing. In the ascites accompanied with anaesthesia of people past the meridian of life it will also sometimes succeed. The method of administering it requires some caution, as it is liable, in greater doses, to induce very violent and debilitating sickness, which continues one or two days, during which time the dropysial collection however disappears. One large spoonful, or half an ounce, of the following decoction, given twice a day, will generally succeed in a few days. But in more robust people, one large spoonful every two hours, till four spoonfuls are taken, or till sickness occurs, will evacuate the dropysial swellings with greater certainty, but is liable to operate more violently. Boil four ounces of the fresh leaves of purple Foxglove (which leaves may be had at all seasons of the year) from two pints of water to twelve ounces; add to the strained liquor, while yet warm, three ounces of rectified spirit of wine. A theory of the effects of this medicine, with many successful cases, may be seen in a pamphlet called, "Experiments on Mucilaginous and Purulent Matter," published by Dr. Darwin in 1780. Sold by Cadell, London.

Marfeilles' good Bishop. l. 435. In the year 1720 and 1722 the Plague made dreadful havoc at Marfeilles; at which time the Bishop was indefatigable in the execution of his pastoral office, visiting, relieving, en-
Raised the weak head and stayed the parting sigh,
Or with new life relumed the swimming eye.—

—And now, PHILANTHROPY! thy rays divine
Dart round the globe from Zembla to the Line;
O'er each dark prison plays the cheering light,
Like northern luftres o'er the vault of night.—

From realm to realm, with cross or crescent crown'd,
Where'er Mankind and Misery are found,
O'er burning sands, deep waves, or wilds of snow,
Thy HOWARD journeying seeks the house of woe.

Down many a winding step to dungeons dank,
Where anguish wails aloud, and fetters clank;

To caves beftrew'd with many a mouldering bone,
And cells, whose echo's only learn to groan;

Where no kind bars a whispering friend disclose,
No sunbeam enters, and no zephyr blows,

HE treads, inemulous of fame or wealth,
Profuse of toil, and prodigal of health;

With soft affuasive eloquence expands
Power's rigid heart, and opens his clinch'ing hands;

couraging, and absolving the sick with extreme tenderness; and though perpetually exposed to the infection, like Sir John Lawrence mentioned below, they both are said to have escaped the disease.

_London's generous Mayor._ l. 435. During the great Plague at London in the year 1665, Sir John Lawrence, the then Lord Mayor, continued the whole time in the city; heard complaints, and redressed them; enforced the wisest regulations then known, and saw them executed. The day after the disease was known with certainty to be the Plague, above 40,000 servants were dismissed, and turned into the streets to perish, for no one would receive them into their houses; and the villages near London drove them away with pitch-forks and fire-arms. Sir John Lawrence supported them all, as well as the needy who were sick, at first by expending his own fortune, till subscriptions could be solicited and received from all parts of the nation. _Journal of the Plague-year._ Printed for E. Nutt, &c. at the R. Exchange, 1722.
Leads stern-eyed Justice to the dark domains,
If not to fever, to relax the chains;
Or guides awaken'd Mercy through the gloom,
And shews the prison, sister to the tomb!—
Gives to her babes the self-devoted wife,
To her fond husband liberty and life!—
—The Spirits of the Good, who bend from high
Wide o'er these earthly scenes their partial eye,
When first, array'd in Virtue's purest robe,
They saw her Howard traversing the globe;
Saw round his brows her sun-like Glory blaze
In arrowy circles of unwearied rays;
Mistook a Mortal for an Angel-Guest,
And ask'd what Seraph-foot the earth impress.
—Onward he moves!—Disease and Death retire,
And murmuring Demons hate him, and admire.”

Here paused the Goddes,—on Hygeia’s shrine
Obsequious Gnomes repose the lyre divine;
Descending Sylphs relax the trembling strings,
And catch the rain-drops on their shadowy wings.
—And now her vase a modest Naiad fills
With liquid crystal from her pebbly rills;
Piles the dry cedar round her silver urn,
(Bright climbs the blaze, the crackling fagots burn),
Culls the green herb of China’s envy’d bowers,
In gaudy cups the steamy treasure pours;
And, sweetly-smiling, on her bended knee
Presents the fragrant quintessence of Tea.
INTERLUDE II.

Bookseller. The monsters of your Botanic Garden are as surprizing as the bulls with brazen feet, and the fire-breathing dragons, which guarded the Hesperian fruit; yet are they not disgusting, nor mischievous: and in the manner you have chained them together in your exhibition, they succeed each other amusingly enough, like prints of the London Cries, wrapped upon rollers, with a glass before them. In this at least they resemble the monsters in Ovid's Metamorphoses; but your similies, I suppose, are Homeric?

Poet. The great Bard well understood how to make use of this kind of ornament in Epic Poetry. He brings his valiant heroes into the field with much parade, and sets them a fighting with great fury; and then, after a few thrusts and parries, he introduces a long string of similies. During this the battle is supposed to continue; and thus the time necessary for the action is gained in our imaginations; and a degree of probability produced, which contributes to the temporary deception or reverie of the reader.

But the similies of Homer have another agreeable characteristic; they do not quadrature, or go upon all fours
(as it is called), like the more formal similes of some modern writers; any one resembling feature seems to be with him a sufficient excuse for the introduction of this kind of digression; he then proceeds to deliver some agreeable poetry on this new subject, and thus converts every simile into a kind of short episode.

B. Then a simile should not very accurately resemble the subject?

P. No; it would then become a philosophical analogy, it would be ratio
cination instead of poetry; it need only so far resemble the subject, as poetry itself ought to resemble nature. It should have so much sublimity, beauty, or novelty, as to interest the reader; and should be expressed in picturesque language, so as to bring the scenery before his eye; and should lastly bear so much of veri-similitude as not to awaken him by the violence of improbability or incongruity.

B. May not the reverie of the reader be diffipated or disturbed by disagreeable images being presented to his imagination, as well as by improbable or incongruous ones?

P. Certainly; he will endeavour to rouse himself from a disagreeable reverie, as from the nightmare. And from this may be discovered the line of boundary between the Tragic and the Horrid: which line, however, will veer a little this way or that, according to the prevailing manners of the age or country, and the peculiar associations of ideas, or idiosyncracy of mind, of individuals. For instance, if an artist should represent the death of an of-
ficer in battle, by shewing a little blood on the bosom of his shirt, as if a bullet had there penetrated, the dying figure would affect the beholder with pity; and if fortitude was at the same time expressed in his countenance, admiration would be added to our pity. On the contrary, if the artist should choose to represent his thigh as shot away by a cannon ball, and should exhibit the bleeding flesh and shattered bone of the stump, the picture would introduce into our minds ideas from a butcher's shop, or a surgeon's operation-room, and we should turn from it with disgust. So if characters were brought upon the stage with their limbs disjointed by torturing instruments, and the floor covered with clotted blood and scattered brains, our theatric reverie would be destroyed by disgust, and we should leave the play-house with detestation.

The Painters have been more guilty in this respect than the Poets; the cruelty of Apollo in slaying Marsyas alive is a favourite subject with the antient artists: and the tortures of expiring martyrs have disgraced the modern ones. It requires little genius to exhibit the muscles in convulsive action, either by the pencil or the chisel, because the interstices are deep, and the lines strongly defined: but those tender gradations of muscular action, which constitute the graceful attitudes of the body, are difficult to conceive or to execute, except by a master of nice discernment and cultivated taste.

B. By what definition would you distinguish the Horrid from the Tragic?

P. I suppose the latter consists of Distress attended with Pity, which is said to be allied to Love, the most agreeable of all our passions; and the former in Distress,
accompanied with Disgust, which is allied to Hate, and is one of our most disagreeable sensations. Hence, when horrid scenes of cruelty are represented in pictures, we wish to disbelieve their existence, and voluntarily exert ourselves to escape from the deception: whereas the bitter cup of true Tragedy is mingled with some sweet solatory drops, which endear our tears, and we continue to contemplate the interesting delusion with a delight which is not easy to explain.

B. Has not this been explained by Lucretius, where he describes a shipwreck; and says, the Spectators receive pleasure from feeling themselves safe on land? and by Akenfide, in his beautiful poem on the Pleasures of Imagination, who ascribes it to our finding objects for the due exertion of our passions?

P. We must not confound our sensations at the contemplation of real misery with those which we experience at the scenical representations of tragedy. The Spectators of a shipwreck may be attracted by the dignity and novelty of the object; and from these may be said to receive pleasure: but not from the distress of the sufferers. An ingenious writer, who has criticised this dialogue in the English Review for August, 1789, adds, that one great source of our pleasure from scenical distress arises from our, at the same time, generally contemplating one of the noblest objects of nature, that of Virtue triumphant over every difficulty and oppression, or supporting its votary under every suffering: or, where this does not occur, that our minds are relieved by the justice of some signal punishment awaiting the delinquent. But, besides this, at the exhibition of a good tragedy, we are not only amused
by the dignity, and novelty, and beauty, of the objects before us; but, if any distressful circumstances occur too forcible for our sensibility, we can voluntarily exert ourselves, and recollect, that the scenery is not real: and thus not only the pain, which we had received from the apparent distress, is lessened, but a new source of pleasure is opened to us, similar to that which we frequently have felt on awakening from a distressful dream; we are glad that it is not true. We are at the same time unwilling to relinquish the pleasure which we receive from the other interesting circumstances of the drama; and on that account quickly permit ourselves to relapse into the delusion; and thus alternately believe and disbelieve, almost every moment, the existence of the objects represented before us.

B. Have those two sovereigns of poetic land, Homer and Shakespeare, kept their works entirely free from the Horrid?—or even yourself in your third Canto?

P. The descriptions of the mangled carcases of the companions of Ulysses, in the cave of Polyphemus, is in this respect certainly objectionable, as is well observed by Scaliger. And in the play of Titus Andronicus, if that was written by Shakespeare (which from its internal evidence I think very improbable), there are many horrid and disgustful circumstances. The following Canto is submitted to the candour of the critical reader, to whose opinions I shall submit in silence.
AND now the Goddess founds her silver shell,  
And shakes with deeper tones the enchanted dell;  
Pale, round her grassy throne, bedew'd with tears,  
Flit the thin forms of Sorrows, and of Fears;  
Soft Sighs responsive whisper to the chords,  
And Indignations half-unsheath their swords.

"Thrice round the grave Circæa prints her tread,  
And chaunts the numbers, which disturb the dead;

_Circæa._ 1. 7. Enchanter's Nightshade. Two males, one female. It was much celebrated in the _mysteries_ of witchcraft, and for the purpose of raising the devil, as its name imports. It grows amid the mouldering bones and decayed coffins in the ruinous vaults of Sleaford-church in Lincolnshire. The superstitious ceremonies or histories belonging to some vegetables have been truly ridiculous; thus the Druids are said to have cropped the Mistletoe with a golden axe or sickle; and
Shakes o'er the holy earth her fable plume,
Waves her dread wand, and strikes the echoing tomb!
—Pale shoot the stars across the troubled night,
The timorous moon withholds her conscious light;
Shrill scream the famish'd bats, and shivering owls,
And loud and long the dog of midnight howls!—
—Then yawns the bursting ground!—two imps obscene
Rise on broad wings, and hail the baleful queen;
Each with dire grin salutes the potent wand,
And leads the forcerefs with his footy hand;
Onward they glide, where sheds the sickly yew
O'er many a mouldering bone its nightly dew;
The ponderous portals of the church unbar,—
Hoarse on their hinge the ponderous portals jar;
As through the colour'd glass the moon-beam falls,
Huge shapeless spectres quiver on the walls;

the Bryony, or Mandrake, was said to utter a scream when its root was
drawn from the ground; and that the animal which drew it up became
diseased and soon died: on which account, when it was wanted for the
purposes of medicine, it was usual to loosen and remove the earth about
the root, and then to tie it by means of a cord to a dog's tail, who was
whipped to pull it up, and was then supposed to suffer for the impiety of
the action. And even at this day bits of dried root of Peony are rub-
bbed smooth, and strung, and sold under the name of Anodyne neck-
laces, and tied round the necks of children, to facilitate the growth of
their teeth! add to this, that in Price's History of Cornwall, a book
published about ten years ago, the Virga Divinatoria, or Divining Rod,
has a decree of credit given to it. This rod is of hazel, or other light
wood, and held horizontally in the hand, and is said to bow towards the
ore whenever the Conjurer walks over a mine. A very few years ago,
in France, and even in England, another kind of divining rod has been
used to discover springs of water in a similar manner, and gained some
credit. And in the very last year, there were many in France, and
some in England, who underwent an enchantment without any divining
rod at all, and believed themselves to be affected by an invisible agent,
which the Enchanter called Animal Magnetism!
Low murmurs creep along the hollow ground,
And to each step the pealing aisles refund;
By glimmering lamps, protecting saints among,
The shrines all tremble as they pass along,
O'er the still choir with hideous laugh they move,
(Fiends yell below, and angels weep above!)
Their impious march to God's high altar bend,
With feet impure the sacred steps ascend;
With wine unblest'd the holy chalice stain,
Assume the mitre, and the cope profane;
To heaven their eyes in mock devotion throw,
And to the cross with horrid mummerly bow;
Adjure by mimic rites the powers above,
And plight alternate their Satanic love.

Avaunt, ye Vulgar! from her sacred groves
With maniac step the Pythian Laura moves;
Full of the God her labouring bosom sighs,
Foam on her lips, and fury in her eyes,

Laura. l. 40. Prunus. Lauro-cerasus. Twenty males, one female.
The Pythian priests is supposed to have been made drunk with infusion
of laurel-leaves when she delivered her oracles. The intoxication or inspi-
ration is finely described by Virgil. Æn. L. vi. The distilled water
from laurel-leaves is, perhaps, the most sudden poison we are acquaint-
ed with in this country. I have seen about two spoonfuls of it destroy
a large pointer dog in less than ten minutes. In a smaller dose it is said
to produce intoxication: on this account there is reason to believe it
acts in the same manner as opium and vinous spirit; but that the dose is
not so well ascertained. See note on Tremella. It is used in the Rata-
tafie of the distillers, by which some dram-drinkers have been suddenly
killed. One pint of water, distilled from fourteen pounds of black
cherry stones bruised, has the same deleterious effect, destroying as sud-
denly as laurel-water. It is probable Apricot-kernels, Peach-leaves,
Walnut-leaves, and whatever possesst the kernel-flavour, may have
similar qualities.
Strong writhe her limbs, her wild dishevell'd hair
Starts from her laurel-wreath, and swims in air.—
While twenty Priests the gorgeous shrine surround
Cinctur'd with ephods, and with garlands crown'd,
Contending hosts and trembling nations wait
The firm immutable behests of Fate;
—She speaks in thunder from her golden throne
With words unwilling, and wisdom not her own.

So on his Nightmare through the evening fog
Flits the squab Fiend o'er fen, and lake, and bog;
Seeks some love-wilder'd Maid with sleep oppreß'd,
Alights, and grinning fits upon her breast.
—Such as of late amid the murky sky
Was mark'd by Fuseli's poetic eye;
Whose daring tints, with Shakespeare's happiest grace,
Gave to the airy phantom form and place.—
Back o'er her pillow sinks her blushing head,
Her snow-white limbs hang helpless from the bed;
While with quick sighs, and suffocative breath,
Her interrupted heart-pulse swims in death.
—Then shrieks of captured towns, and widows' tears,
Pale lovers stretch'd upon their blood-stain'd biers,
The headlong precipice that thwarts her flight,
The trackless desert, the cold starless night,
And stern-eye'd Murderer with his knife behind,
In dread succession agonize her mind.
O'er her fair limbs convulsive tremors fleet,
Start in her hands, and struggle in her feet;
In vain to scream with quivering lips she tries,
And strains in palsy'd lids her tremulous eyes;
In vain the wills to run, fly, swim, walk, creep; 
The will presides not in the bower of sleep. 
On her fair bosom fits the Demon-Ape 
Erect, and balances his bloated shape; 
Rolls in their marble orbs his Gorgon-eyes, 
And drinks with leathern ears her tender cries.

The Will presides not. 1. 74. Sleep consists in the abolition of all voluntary power, both over our muscular motions and our ideas; for we neither walk nor reason in sleep. But, at the same time, many of our muscular motions, and many of our ideas, continue to be excited into action in consequence of internal irritations and of internal sensations; for the heart and arteries continue to beat, and we experience variety of passions, and even hunger and thirst in our dreams. Hence I conclude, that our nerves of sense are not torpid or inert during sleep; but that they are only precluded from the perception of external objects, by their external organs being rendered unfit to transmit to them the appulses of external bodies, during the suspension of the power of volition; thus the eyelids are closed in sleep, and I suppose the tympanum of the ear is not stretched, because they are deprived of the voluntary exertions of the muscles appropriated to these purposes; and it is probable something similar happens to the external apparatus of our other organs of sense, which may render them unfit for their office of perception during sleep: for milk put into the mouths of sleeping babes occasions them to swallow and suck; and, if the eye-lid is a little opened in the day-light by the exertions of disturbed sleep, the person dreams of being much dazzled. See first Interlude.

When there arises in sleep a painful desire to exert the voluntary motions, it is called the Nightmare or Incubus. When the sleep becomes so imperfect that some muscular motions obey this exertion of desire, people have walked about, and even performed some domestic offices in sleep; one of these sleep-walkers I have frequently seen: once she smelt of a tube-rose, and sung, and drank a dish of tea in this state; her awaking was always attended with prodigious surprize, and even fear; this disease had daily periods, and seemed to be of the epileptic kind.
Arm'd with her ivory beak, and talon-hands,
Defending Fica dives into the sands;
Chamber'd in earth with cold oblivion lies;
Nor heeds, ye Suitor-train, your amorous sighs;
Erewhile with renovated beauty blooms,
Mounts into air, and moves her leafy-plumes.
Where Hamps and Manifold, their cliffs among,
Each in his flinty channel winds along;
With lucid lines the dusky Moor divides,
Hurrying to intermix the sifter tides.
Where 'till their silver-bottom'd Nymphs abhor
The blood smear'd mansion of gigantic Thor,—

Ficus indica. l. 80. Indian Fig-tree. Of the class Polygamy. This large tree rifes with opposite branches on all sides, with long egged leaves; each branch emits a slender flexile depending appendage from its summit like a cord, which roots into the earth and rifes again. Sloan, Hift. of Jamaica. Lin. Spec. Plant. See Capri-ficus.

Gigantic Thor. l. 90. Near the village of Wetton, a mile or two above Dove-Dale, near Ashburn in Derbyshire, there is a spacious cavern about the middle of the ascent of the mountain, which till retains the Name of Thor's house; below is an extensive and romantic common, where the rivers Hamps and Manifold sink into the earth, and rise again in Ilam gardens, the seat of John Port, Esq. about three miles below. Where these rivers rife again there are impressions resembling Fish, which appear to be of Jasper bedded in Limestone. Calcereous Spars, Shells converted into a kind of Agate, corallines in Marble, ores of Lead, Copper, and Zinc, and many strata of Flint, or Chert, and of Toadstone, or Lava, abound in this part of the country. The Druids are said to have offered human sacrifices inclosed in wicker idols to Thor. Thursday had its name from this Deity.

The broken appearance of the surface of many parts of this country; with the Swallows, as they are called, or basons on some of the mountains, like volcanic Craters, where the rain-water sinks into the earth; and the numerous large stones, which seem to have been thrown over the land by volcanic explosions; as well as the great masses of Toad-
—Erst, fires volcanic in the marble womb
Of cloud wrapp'd wetton raised the massy dome;
Rocks rear'd on rocks in huge disjointed piles
Form the tall turrets, and the lengthen'd ailes;
Broad ponderous piers sustaine the roof, and wide
Branch the vast rain-bow ribs from side to side.
While from above descends in milky streams
One scanty pencil of illusive beams,
Suspended crags and gaping gulphs illumes,
And gilds the horrors of the deepen'd glooms.

Here oft the Naiads, as they chanced to play
Near the dread Fane on Thor's returning day,
Saw from red altars streams of guiltless blood
Stain their green reed-beds, and pollute their flood;
Heard dying babes in wicker prisons wail,
And shrieks of matrons thrill the affrighted Gale;
While the dark caves infernal Echoes mock,
And Fiends triumphant shout from every rock!
—So still the Nymphs emerging lift in air
Their snow-white shoulders and their azure hair;

Sail with sweet grace the dimpling streams along,
Listening the Shepherd's or the Miner's song;
But, when afar they view the giant-cave,
On timorous fins they circle on the wave,

Stone or Lava; evince the existence of violent earthquakes at some early period of the world. At this time the channels of these subterraneous rivers seem to have been formed, when a long tract of rocks were raised by the sea flowing in upon the central fires, and thus producing an irresistible explosion of steam; and when these rocks again subsided, their parts did not exactly correspond, but left a long cavity arched over in this operation of nature. The cavities at Castleton and Buxton in Derbyshire seem to have had a similar origin, as well as this cavern termed Thor's house. See Mr. Whitehurst's and Dr. Hutton's Theories of the Earth.
With streaming eyes and throbbing hearts recoil,
Plunge their fair forms, and live beneath the foil.
Clofed round their heads reluctant eddies sink,
And wider rings successive dash the brink.
Three thousand steps in sparary clefts they stray,
Or seek through fullen mines their gloomy way;
On beds of Lava sleep in coral cells,
Or sigh o'er jasper fish, and agate shells.
Till, where famed ILAM leads his boiling floods
Through flowery meadows and impending woods,
Pleased with light spring they leave the dreary night,
And 'mid circumfluent surges rise to light;
Shake their bright locks, the widening vale pursue,
Their sea-green mantles fringed with pearly dew;
In playful groups by towering THRIP they move,
Bound o'er the foaming wears, and rush into the Dove.

With fierce distracted eye IMPATIENS stands,
Swells her pale cheeks, and brandishes her hands,

Impatiens l. 131. Touch me not. The seed vessel consists of one cell
with five divisions; each of these, when the seed is ripe, on being touched,
suddenly folds itself into a spiral form, leaps from the stalk, and dif-
eres the seeds to a great distance by its elasticity. The capsule of the
eranium and the beard of wild oats are twisted for a similar purpose,
and dislodge their seeds on wet days, when the ground is best fitted to
receive them. Hence one of these, with its adhering capsule or beard
xed on a stand, serves the purpose of an hygrometer, twisting itself
ore or less according to the moisture of the air.

The awn of barley is furnished with stiff points, which, like the teeth
of a saw, are all turned towards the point of it; as this long awn lies
pon the ground, it extends itself in the moist air of night, and pushes
wards the barley corn, which it adheres to; in the day it shortens as
of dries; and as these points prevent it from receding, it draws up its
ointed end; and thus, creeping like a worm, will travel many feet
With rage and hate the astonish'd groves alarms,
And hurls her infants from her frantic arms.
—So when Medea left her native soil
Unaw'd by danger, unsubdued by toil;
Her weeping sire and beckoning friends withstood,
And launch'd enamour'd on the boiling flood;
One ruddy boy her gentle lips cares'd,
And one fair girl was pillow'd on her breast;
While high in air the golden treasure burns,
And Love and Glory guide the prow by turns.
But, when Theffalia's inauspicious plain
Received the matron-heroine from the main;
While horns of triumph found, and altars burn,
And shouting nations hail their Chief's return;
Aghast, she saw new-deck'd the nuptial bed,
And proud Creusa to the temple led;
Saw her in Jason's mercenary arms
Deride her virtues, and insult her charms;
Saw her dear babes from fame and empire torn,
In foreign realms deserted and forlorn;
Her love rejected, and her vengeance braved,
By Him her beauties won, her virtues saved.—

from the parent stem. That very ingenious mechanic Philosopher, Mr. Edgeworth, once made on this principle a wooden automaton; its back consisted of soft Fir-wood, about an inch square, and four feet long, made of pieces cut the cross way in respect to the fibres of the wood, and glued together: it had two feet before, and two behind, which supported the back horizontally; but were placed with their extremities, which were armed with sharp points of iron, bending backwards. Hence, in moist weather, the back lengthened, and the two foremost feet were pushed forwards; in dry weather the hinder feet were drawn after, as the obliquity of the points of the feet prevented it from receding. And thus, in a month or two, it walked across the room which it inhabited. Might not this machine be applied as an Hygrometer to some meteorological purpose?
With stern regard she eyed the traitor-king, And felt, Ingratitude! thy keenest fling;
"Nor Heaven," She cried, "nor Earth, nor Hell can hold
"A Heart abandon'd to the thirst of Gold!"
Stamp'd with wild foot, and shook her horrent brow, And call'd the furies from their dens below.
—Slow out of earth, before the festive crowds, On wheels of fire, amid a night of clouds, Drawn by fierce fiends arose a magic car, Received the Queen, and hovering flamed in air.— As with raised hands the suppliant traitors kneel
And fear the vengeance they deserve to feel,
Thrice with parch'd lips her guiltless babes she press'd, And thrice she clasp'd them to her tortur'd breast;
Awhile with white uplifted eyes she stood, Then plung'd her trembling poniards in their blood.
"Go, kiss your fire! go, share the bridal mirth!"
She cry'd, and hurl'd their quivering limbs on earth. Rebellowing thunders rock the marble towers, And red-tongued lightnings shoot their arrowy showers; Earth yawns!—the crashing ruin sinks!—o'er all
Death with black hands extends his mighty Pall;
Their mingling gore the Fiends of Vengeance quaff, And Hell receives them with convulsive laugh.

Round the vex'd isles where fierce tornados roar, Or tropic breezes soothe the sultry shore;
What time the Eve her gauze pellucid spreads O'er the dim flowers, and veils the misty meads;
Slow, o'er the twilight sands or leafy walks, With gloomy dignity Dictamna stalks;

Dictamnus l. 184. Fraxinella. In the still evenings of dry seasons this plant emits an inflammable air or gas, and flashes on the approach
In sulphurous eddies round the weird dame
Plays the light gas, or kindles into flame.
If fits the traveller his weary heads,
Grim Mancinella haunts the mossy bed,
of a candle. There are instances of human creatures who have taken
fire spontaneously, and been totally consumed. Phil. Trans.
The odours of many flowers, so delightful to our sense of smell, as
well as the disagreeable scents of others, are owing to the exhalation of
their essential oils. These essential oils have greater or less volatility,
and are all inflammable; many of them are poisonous to us, as these of
Laurel and Tobacco; others possess a narcotic quality, as is evinced by
the oil of cloves instantly relieving flight tooth-achs; from oil of cinnamon
relieving the hiccup; and balsam of Peru relieving the pain of some
ulcers. They are all deleterious to certain insects, and hence their use
in the vegetable economy being produced in flowers or leaves to protect
them from the depredations of their voracious enemies. One of the
essential oils, that of turpentine, is recommended, by M. de Thou, for
the purpose of destroying insects which infest both vegetables and
animals. Having observed that the trees were attacked by multitudes of
small insects of different colours (pucins on pucerons), which injured their
young branches, he destroyed them all entirely in the following manner:
he put into a bowl a few handfuls of earth, on which he poured a small
quantity of oil of turpentine; he then beat the whole together with a
spatula, pouring on it water till it became of the consistence of soup;
with this mixture he moistened the ends of the branches, and both the
insects and their eggs were destroyed, and other insects kept aloof by the
scent of the turpentine. He adds, that he destroyed the fleas of his
puppies by once bathing them in warm water impregnated with oil of
I sprinkled some oil of turpentine, by means of a brush, on some
branches of a nectarine-tree, which was covered with the aphid; but it
killed both the insects and the branches: a solution of arsenic much dil-
luted did the same. The shops of medicine are supplied with resins,
balsams, and essential oils; and the tar and pitch, for mechanical pur-
poses, are produced from these vegetable secretions.

Mancinella. l. 188. Hyppomane. With the milky juice of this tree
the Indians poison their arrows; the dew-drops, which fall from it, are
so caustic as to blister the skin, and produce dangerous ulcers; whence
many have found their death by sleeping under its shade. Variety of
Breeds her black hebenon, and, stealing near,
Pours the curst venom in his tortured ear.—
Wide o'er the mad'ning throng Urtica flings
Her barbed shafts, and darts her poison'd darts.
And fell Lobelia's suffocating breath
Loads the dank pinion of the gale with death.

noxious plants abound in all countries; in our own the deadly night-
shade, henbane, hounds-tongue, and many others, are seen in almost
every high-road untouched by animals. Some have asked, what is the
use of such abundance of poisons? The nauseous or pungent juices of
some vegetables, like the thorns of others, are given them for their de-
fence from the depredations of animals; hence the thorny plants are in
general wholesome and agreeable food to graminivorous animals. See
note on Ilex. The flowers or petals of plants are perhaps in general
more acrid than their leaves; hence they are much seldom eaten by in-
sects. This seems to have been the use of the essential oil in the vege-
table economy, as observed above in the notes on Dictamnus and on
Ilex. The fragrance of plants is thus a part of their defence. These
pungent or nauseous juices of vegetables have supplied the science of
medicine with its principal materials, such as purge, vomit, intoxicate,
&c.

Urtica. l. 191. Nettle. The fling has a bag at its base, and a perfo-
ration near its point, exactly like the flings of wasps and the teeth of
adders; Hook, Microgr. p. 142. 1st the fluid contained in this bag, and
pressed through the perforation into the wound, made by the point, a
cauftic effential oil, or a concentrated vegetable acid? The vegetable
poisons, like the animal ones, produce more sudden and dangerous ef-
fects, when inftilled into a wound, than when taken into the stomach;
whence the families of Marfi and Pflili, in ancient Rome, sucked the
poison without injury out of wounds made by vipers, and were sup-
pced to be indued with supernatural powers for this purpose. By the
experiments related by Beccaria, it appears that four or five times the
quantity, taken by the mouth, had about equal effects with that infused
into a wound. The male flowers of the nettle are separate from the fe-
male, and the anthers are seen in fair weather to burst with force, and
to discharge a duff, which hovers about the plant like a cloud.

Lobelia. l. 193. Longiflora. Grows in the West Indies, and spreads
such deleterious exhalations around it, that an oppression of the breast
Lo! from one root, the envenom'd soil below,
A thousand vegetative serpents grow;
In shining rays the scaly monster spreads
O'er ten square leagues his far-diverging heads;
Or in one trunk entwists his tangled form,
Looks o'er the clouds, and hisses in the storm.
Steep'd in fell poison, as his sharp teeth part,
A thousand tongues in quick vibration dart;
Snatch the proud Eagle towering o'er the heath,
Or pounce the Lion, as he stalks beneath;
Or strew, as marshall'd hosts contend in vain,
With human skeletons the whiten'd plain.
—Chain'd at his root two scion-demons dwell,
Breathe the faint hiss, or try the shriller yell;
Rise, fluttering in the air on callow wings,
And aim at insect-prey their little stings.
So Time's strong arms with sweeping scythe erase
Art's cumbrous works, and empires, from their base;
While each young Hour its sickle fine employs,
And crops the sweet buds of domestic joys!

pared; and, to gain this, the condemned criminals are sent to the tree
with proper direction both to get the juice and to secure themselves
from the malignant exhalations of the tree; and are pardoned if they
bring back a certain quantity of the poison. But by the registers there
kept, not one in four are said to return. Not only animals of all kinds,
both quadrupeds, fish, and birds, but all kinds of vegetables also are
destroyed by the effluvia of the noxious tree; so that, in a district of 12
or 14 miles round it, the face of the earth is quite barren and rocky,
intermixed only with the skeletons of men and animals; affording a
scene of melancholy beyond what poets have described or painters deli-
neated. Two younger trees of its own species are said to grow near it.
See London Magazine for 1784, or 1783. Translated from a description
of the poison-tree of the island of Java, written in Dutch by N. P.
Foereh. For a further account of it, see a note at the end of the work.
With blushes bright as morn fair Orchis charms,
And lulls her infant in her fondling arms;

Orchis. I. 259. The Orchis morio in the circumstance of the parent-root shrivelling up and dying, as the young one increases, is not only analogous to other tuberous or knobby roots, but also to some bulbous roots, as the tulip. The manner of the production of herbaceous plants from their various perennial roots, seems to want further investigation, as their analogy is not yet clearly established. The caudex, or true root, in the orchis lies above the knob; and from this part the fibrous roots and the new knob are produced. In the tulip the caudex lies below the bulb; from whence proceed the fibrous roots and the new bulbs; and I suspect the tulip-root, after it has flowered, dies like the orchis-root; for the stem of the last year's tulip lies on the outside, and not in the centre of the new bulb; which I am informed does not happen in the three or four first years when raised from seed, when it only produces a stem, and slender leaves without flowering. In the tulip-root, disintegrated in the early spring, just before it begins to shoot, a perfect flower is seen in its centre; and between the first and second coat the large next year's bulb is, I believe, produced; between the second and third coat, and between this and the fourth coat, and perhaps further, other less and less bulbs are visible, all adjoining to the caudex at the bottom of the mother bulb; and which, I am told, require as many years before they will flower, as the number of the coats with which they are covered. This annual reproduction of the tulip-root induces some florists to believe that tulip-roots never die naturally, as they lose so few of them; whereas the hyacinth-roots, I am informed, will not last above five or seven years after they have flowered.

The hyacinth-root differs from the tulip-root, as the stem of the last year's flower is always found in the centre of the root, and the new offsets arise from the caudex below the bulb, but not beneath any of the concentric coats of the root, except the external one: hence Mr. Eaton, an ingenious florist of Derby, to whom I am indebted for most of the observations in this note, concludes, that the hyacinth-root does not perish annually after it has flowered like the tulip. Mr. Eaton gave me a tulip root which had been set too deep in the earth, and the caudex had elongated itself near an inch, and the new bulb was formed above the old one, and detached from it, instead of adhering to its side.

The caudex of the ranunculus, cultivated by the florists, lies above the claw-like root; in this the old root or claws die annually, like the tulip or orchis, and the new claws, which are seen above the old ones,
Soft plays Affection round her bosom's throne,
And guards his life, forgetful of her own.
So wings the wounded deer her headlong flight,
Pierced by some ambush'd archer of the night,
Shoots to the woodlands with her bounding fawn,
And drops of blood bedew the conscious lawn;
There hid in shades she shuns the cheerful day,
Hangs o'er her young, and weeps her life away.

So stood Eliza on the wood-crown'd height,
O'er Minden's plain, spectator of the fight,
Sought with bold eye amid the bloody strife
Her dearer self, the partner of her life;
From hill to hill the rushing host pursued,
And view'd his banner, or believed the view'd.
Pleased with the distant roar, with quicker tread
Fast by his hand one lisping boy she led;
And one fair girl amid the loud alarm
Slept on her kerchief, cradled by her arm;
While round her brows bright beams of Honour dart,
And Love's warm eddies circle round her heart.
—Near and more near the intrepid Beauty press'd,
Saw through the driving smoke his dancing crest,
Saw on his helm, her verging hands inwove,
Bright stars of gold, and mystic knots of love;

draw down the caudex lower into the earth. The same is said to happen to Scabiosa, or Devil's bit, and some other plants, as valerian and greater plantain; the new fibrous root rising round the caudex above the old ones, the inferior end of the root becomes flumped, as if cut off, after the old fibres are decayed, and the caudex is drawn down into the earth by these new roots. See Arum and Tulipa.
Heard the exulting shout, "they run! they run!"
"Great God!" she cried, "He's safe! the battle's won!"
—A ball now hisses through the airy tides,

(Some Fury wing'd it, and some Demon guides!) Parts the fine locks, her graceful head that deck,
Wounds her fair ear, and sinks into her neck;
The red stream, issuing from her azure veins,
Dyes her white veil, her ivory bosom stains.—

"Ah me!" she cried, and, sinking on the ground, Kis'd her dear babes, regardless of the wound;
"Oh, cease not yet to beat, thou Vital Urn!
"Wait, gushing Life, oh, wait my Love's return—
"Hoarse barks the wolf, the vulture screams from far!—
The angel, Pity, shuns the walks of war!—
"Oh, spare ye War-hounds, spare their tender age!—
"On me, on me," she cried, "exhaust your rage!"—
Then with weak arms her weeping babes cares'd,
And sighing hid them in her blood-stain'd vest.

From tent to tent the impatient warrior flies,
Fear in his heart, and frenzy in his eyes;
Eliza's name along the camp he calls,
Eliza echoes through the canvas walls;
Quick through the murmuring gloom his footsteps tread,
O'er groaning heaps, the dying and the dead,
Vault o'er the plain, and in the tangled wood,
Lo! dead Eliza weltering in her blood!—
—Soon hears his listening son the welcome sounds,
With open arms and sparkling eyes he bounds:
"Speak low," he cries, and gives his little hand,
"Eliza sleeps upon the dew-cold sand;
"Poor weeping Babe with bloody fingers press'd,
"And tried with pouting lips her milkless breast;
“Alas! we both with cold and hunger quake—

“Why do you weep?—Mama will soon awake.”

—“She’ll wake no more!” the hopeless mourner cried,
Upturn’d his eyes, and clasp’d his hands, and sigh’d;
Stretch’d on the ground awhile entranc’d he lay,
And press’d warm kifles on the lifeless clay;
And then upsprung with wild convulsive start,
And all the Father kindled in his heart;

“Oh, heavens!” he cried, “my first rash vow forgive!
These bind to earth, for these I pray to live!”—
Round his chill babes he wrapp’d his crimson vest,
And clasp’d them sobbing to his aching breast.

Two Harlot-Nymphs, the fair Cuscutas, please
With labour’d negligence, and studied ease;

Cuscuta. l. 327. Dodder. Four males, two females. This parasite plant (the seed splitting without cotyledons), protrudes a spiral body, and not endeavouring to root itself in the earth ascends the vegetables in its vicinity, spirally W. S. E. or contrary to the movement of the sun; and absorbs its nourishment by vessels apparently inserted into its supporters. It bears no leaves except here and there a scale, very small, membranous, and close under the branch. Lin. Spec. Plant. edit. a Reichard. Vol. I. p. 352. The Rev. T. Martyn, in his elegant letters on botany, adds, that, not content with support, where it lays hold, there it draws its nourishment; and at length, in gratitude for all this, strangles its entertainer. Let. xv. A contest for air and light obtains throughout the whole vegetable world; shrubs rise above herbs; and, by precluding the air and light from them, injure or destroy them; trees suffocate or incommode shrubs; the parasite climbing plants, as Ivy, Clematis, incommode the taller trees; and other parasites, which exist without having roots on the ground, as Mistletoe, Tillandsia, Epipendium, and the mosses and fungufes, incommode them all.

Some of the plants with voluble stems ascend other plants spirally eaff-fourth-weft, as Humulus, Hop, Loniceria, Honey-fuckle, Tamus, black Bryony, Helxine. Others turn their spiral stems west-fourth-east, as Convolvulus, Corn-bind, Phafeolus, Kidney-bean, Basella, Cynanche, Euphorbia, Eupatorium. The proximate or final causes of this
In the meek garb of modest worth disguifed,
The eye averted, and the smile chastifed,
With fly approach they spread their dangerous charms.
And round their victim wind their wiry arms.
So by Scamander when Laocoön flood,
Where Troy's proud turrets glitter'd in the flood,
Raised high his arms, and with prophetic call
To shrinking realms announced her fatal fall;
Whirl'd his fierce spear with more than mortal force,
And pierced the thick ribs of the echoing horse;
Two Serpent-forms incumbent on the main,
Lashing the white waves with redundant train,
Arch'd their blue necks, and shook their towering crefts,
And plough'd their foamy way with speckled breasts;
Then darting fierce amid the affrighted throngs,
Roll'd their red eyes, and shot their forked tongues—
—Two daring Youths to guard the hoary fire
Thwart their dread progress, and provoke their ire.
Round fire and fons the scaly monsters roll'd,
Ring above ring, in many a tangled fold,

difference have not been investigated. Other plants are furnished with
tendrils for the purpose of climbing: if the tendril meets with nothing
to lay hold of in its first revolution, it makes another revolution; and
so on till it wraps itself quite up like a cork-screw; hence, to a careless
observer, it appears to move gradually backwards and forwards, being
seen sometimes pointing eastward and sometimes westward. One of the
Indian grasses, Panicum arborefeens, whose stem is no thicker than a
goofe-quill, rises as high as the tallest trees in this contest for light and
plants are tender from their quick growth; and, when deprived of
their acrimony by boiling, are an agreeable article of food. The Hop-
tops are in common use. I have eaten the tops of white Bryony, Bry-
onia alba, and found them nearly as grateful as Asparagus, and think
this plant might be profitably cultivated as an early garden-vegetable.
The Tamus (called black Bryony), was less agreeable to the taste when
boiled. See Galanthus.
And, bending low to earth, with pious hands
Inhumes her dear Departed in the sands.

"Sweet Nurfling! withering in thy tender hour,
"Oh, sleep," She cries, "and rise a fairer flower!"

—So when the Plague o'er London's gasping crowds
Shook her dank wing, and steer'd her murky clouds;
When o'er the friendless bier no rites were read,
No dirge flow-chanted, and no pall out-spread;
While Death and Night piled up the naked throng,
And Silence drove their ebon cars along;

Six lovely daughters, and their father, wept
To the throng'd grave Cleone saw, and wept;
Her tender mind, with meek Religion fraught,
Drank all- resigned Affliction's bitter draught;
Alive and listening to the whisper'd groan
Of others' woes, unconscious of her own!

One smiling boy, her last sweet hope, she warms
Hush'd on her bosom, circled in her arms,—
Daughter of woe! ere morn, in vain cares'd,
Clung the cold Babe upon thy milkless breast;

With feeble cries thy last sad aid required,
Stretch'd its stiff limbs, and on thy lap expired!—
—Long with wide eye-lids on her Child she gazed,
And long to heaven their tearless orbs she raised;

earth; which, however, in this plant may be only an attempt to conceal its seeds from the ravages of the birds; for there is another trefoil, the trifolium globosum, or globular wholly-headed trefoil, which has a curious manner of concealing its seeds; the lower florets only have corols and are fertile; the upper ones wither into a kind of wool, and, forming a head, completely conceal the fertile calyces. Lin. Spec. Plant. a Reichard.
Then with quick foot and throbbing heart she found 405
Where Chartreuse open'd deep his holy ground;
Bore his last treasure through the midnight gloom,
And kneeling dropp'd it in the mighty tomb;
"I follow next!" the frantic mourner said,
And living plunged amid the festering dead. 410

Where vast Ontario rolls his brineless tides,
And feeds the trackless forests on his sides,
Fair Cassia trembling hears the howling woods,
And trusts her tawny children to the floods.—

Where Chartreuse. l. 406. During the plague in London, 1665, one
pit to receive the dead was dug in the Charter-house, 40 feet long, 16
feet wide, and about 20 feet deep; and in two weeks received 1144 bo-
dies. During this dreadful calamity there were instances of mothers
carrying their own children to those public graves, and of people deliri-
ous, or in despair from the loss of their friends, who threw themselves
alive into these pits. Journal of the Plague-year in 1665, printed for
E. Nutt, Royal-Exchange.

Rolls his brineless tides. l. 411. Some philosophers have believed that
the continent of America was not raised out of the great ocean at so
early a period of time as the other continents. One reason for this opi-
nion was, because the great lakes, perhaps nearly as large as the Medi-
terranean Sea, consist of fresh water. And as the sea-salt seems to have
its origin from the destruction of vegetable and animal bodies, washed
down by rains, and carried by rivers into lakes or seas; it would seem
that this source of sea-salt had not so long existed in that country.
There is, however, a more satisfactory way of explaining this circum-
stance; which is, that the American lakes lie above the level of the
ocean, and are hence perpetually defalted by the rivers which run
through them; which is not the case with the Mediterranean, into
which a current from the main ocean perpetually paffes.

Coffia. l. 413. Ten males, one female. The seeds are black, the fla-
mens gold-colour. This is one of the American fruits, which are an-
ually thrown on the coasts of Norway; and are frequently in so recent
a state as to vegetate, when properly taken care of, the fruit of the ana-
Cinched with gold while ten fond brothers stand, and guard the beauty on her native land,

cardium, calcew-nut; of cucurbita lageneria, bottlegourd; of the mimosa fiandens, cocoons; of the pisidix erythrina, logwood-tree; and cocoa-nuts are enumerated by Dr. Tonning (Amen. Acad. 149.) amongst these emigrant seeds. The fact is truly wonderful, and cannot be accounted for but by the existence of under currents in the depths of the ocean; or from vortexes of water passing from one country to another through caverns of the earth.

Sir Hans Sloane has given an account of four kinds of seeds, which are frequently thrown by the sea upon the coasts of the islands of the northern parts of Scotland. Phil. Trans. abridged, Vol. III. 540. which seeds are natives of the West Indies, and seem to be brought thither by the gulf-stream described below. One of these is called, by Sir H. Sloane, Phascolus maximus perennis, which is often also thrown on the coast of Kerry in Ireland; another is called, in Jamaica, Horse-eye-bean; and a third is called Niker in Jamaica. He adds, that the Lenticula marina, or Sargosol, grows on the rocks about Jamaica, is carried by the winds and current towards the coast of Florida, and thence into the North-American ocean, where it lies very thick on the surface of the sea.

Thus a rapid current passes from the gulf of Florida to the N. E. along the coast of North-America, known to seamen by the name of the Gulf-stream. A chart of this was published by Dr. Franklin in 1768, from the information principally of Capt. Folger. This was confirmed by the ingenious experiments of Dr. Blagden, published in 1781, who found that the water of the Gulf-stream was from fix to eleven degrees warmer than the water of the sea through which it ran; which must have been occasioned by its being brought from a hotter climate. He ascribes the origin of this current to the power of the trade-winds, which, blowing always in the same direction, carry the waters of the Atlantic ocean to the westward, till they are stopped by the opposing continent on the west of the Gulf of Mexico, and are thus accumulated there, and run down the Gulf of Florida. Philof. Trans. V. 71. p. 335. Governor Pownal has given an elegant map of this Gulf-stream, tracing it from the Gulf of Florida north-ward as far as Cape Sable in Nova Scotia, and then across the Atlantic ocean to the coast of Africa between the Canary-islands and Senegal, increasing in breadth, as it runs, till it occupies five or six degrees of latitude. The Governor likewise ascribes
Soft breathes the gale, the current gently moves,
And bears to Norway's coasts her infant-loves.
—So the sad mother at the noon of night
From bloody Memphis stole her silent flight;
Wrapp'd her dear babe beneath her folded vest,
And clasp'd the treasure to her throbbing breast,
With soothing whispers hush'd its feeble cry,
Press'd the soft kiss, and breathed the secret sigh.—
—With dauntless step she seeks the winding shore,
Hears unappall'd the glimmering torrents roar;
With Paper-flags a floating cradle weaves,
And hides the smiling boy in Lotus-leaves;
Gives her white bosom to his eager lips,
The salt tears mingling with the milk he sips;
Waits on the reed-crown'd brink with pious guile,
And trusts the scaly monsters of the Nile.—
—Erewhile majestic from his lone abode,
Embassador of Heaven, the Prophet trod;

this current to the force of the trade-winds protruding the waters westward, till they are opposed by the continent, and accumulated in the Gulf of Mexico. He very ingeniously observes, that a great eddy must be produced in the Atlantic ocean between this Gulf-stream and the westerly current protruded by the tropical winds, and in this eddy are found the immense fields of floating vegetables, called Saragoa weeds, and Gulf-weeds, and some light woods, which circulate in these vast eddies, or are occasionally driven out of them by the winds. Hydraulic and Nautical Observations by Governor Pownal, 1787. Other currents are mentioned by the Governor in this ingenious work, as those in the Indian Seas, northward of the line, which are ascribed to the influence of the Monsoons. It is probable, that in process of time the narrow tracts of land on the west of the Gulf of Mexico may be worn away by this elevation of water dashing against it, by which this immense current would cease to exist, and a wonderful change take place in the Gulf of Mexico and West Indian islands, by the subsiding of the sea, which might probably lay all those islands into one, or join them to the continent.
Wrench'd the red Scourge from proud Oppression's hands
And broke, curst Slavery! thy iron bands.

Hark! heard ye not that piercing cry,
Which shook the waves and rent the sky!－－

E'en now, e'en now, on yonder Western shores
Weeps pale Despair, and writhing Anguish roars:
E'en now in Afric's groves with hideous yell
Fierce Slavery stalks, and flips the dogs of hell;
From vale to vale the gathering cries rebound,
And fable nations tremble at the sound!－－
—Ye Bands of Senators! whose suffrage sways
Britannia's realms, whom either Ind obeys;
Who right the injured, and reward the brave,
Stretch your strong arm, for ye have power to save!
Throned in the vaulted heart, his dread resort,
Inexorable Conscience holds his court;
With still small voice of plots of Guilt alarms,
Bares his mask'd brow, his lifted hand disarms;
But, wrapp'd in night with terrors all his own,
He speaks in thunder, when the deed is done.
Hear him, ye Senators! hear this truth sublime,
"He, who allows Oppression, sharest the crime."

No radiant pearl, which crested Fortune wears,
No gem, that twinkling hangs from Beauty's ears,
Not the bright stars, which Night's blue arch adorn,
Nor rising suns that gild the vernal morn,
Shine with such lustre as the tear, that breaks
For others' woe down Virtue's manly cheeks."
Here ceased the Muse, and dropp'd her tuneful shell,
Tumultuous woes her panting bosom swell,
O'er her flush'd cheek her gauzy veil she throws,
Folds her white arms, and bends her laurel'd brows;
For human guilt awhile the Goddes's sighs,
And human sorrows dim celestial eyes.
Bookfeller. **Poetry** has been called a sister-art both to Painting and to Music; I wish to know, what are the particulars of their relationship?

**Poet.** It has been already observed, that the principal part of the language of poetry consists of those words, which are expressive of the ideas, which we originally receive by the organ of sight; and in this it nearly indeed resembles painting; which can express itself in no other way, but by exciting the ideas or sensations belonging to the sense of vision. But besides this essential similitude in the language of the poetic pen and pencil, these two sifTer resemble each other, if I may so say, in many of their habits and manners. The Painter, to produce a strong effect, makes a few parts of his picture large, distinct, and luminous, and keeps the remainder in shadow, or even beneath its natural size and colour, to give eminence to the principal figure. This is similar to the common manner of poetic composition, where the subordinate characters are kept down, to elevate and give consequence to the hero or heroine of the piece.

In the south aisle of the cathedral church at Litchfield,
there is an ancient monument of a recumbent figure; the head and neck of which lie on a roll of matting in a kind of niche or cavern in the wall; and about five feet distant horizontally in another opening or cavern in the wall are seen the feet and ankles, with some folds of garment, lying also on a matt; and though the intermediate space is a solid stone-wall, yet the imagination supplies the deficiency, and the whole figure seems to exist before our eyes. Does not this resemble one of the arts both of the painter and the poet? The former often shows a muscular arm amidst a group of figures, or an impassioned face; and, hiding the remainder of the body behind other objects, leaves the imagination to complete it. The latter, describing a single feature or attitude in picturesque words, produces before the mind an image of the whole.

I remember seeing a print, in which was represented a shrivelled hand stretched through an iron grate, in the stone floor of a prison-yard, to reach at a meal of porridge, which affected me with more horrid ideas of the distress of the prisoner in the dungeon below, than could have been perhaps produced by an exhibition of the whole person. And in the following beautiful scenery from the Midsummer-night’s dream, (in which I have taken the liberty to alter the place of a comma), the description of the swimming step and prominent belly bring the whole figure before our eyes with the distinctness of reality.

When we have laugh’d to see the fails conceive,
And grow big-bellied with the wanton wind;
Which she with pretty and with swimming gate,
Following her womb, (then rich with my young squire),
Would imitate, and fail upon the land.
There is a third sister-feature, which belongs both to the pictorial and poetic art; and that is the making sentiments and passions visible, as it were, to the spectator; this is done in both arts by describing or portraying the effects or changes which those sentiments or passions produce upon the body. At the end of the unaltered play of Lear, there is a beautiful example of poetic painting; the old King is introduced as dying from grief for the loss of Cordelia; at this crisis, Shakespeare, conceiving the robe of the king to be held together by a clasp, represents him as only saying to an attendant courtier in a faint voice, "Pray, Sir, undo this button,—thank you, Sir," and dies. Thus by the art of the poet, the oppression at the bosom of the dying King is made visible, not described in words.

B. What are the features, in which these sister-arts do not resemble each other?

P. The ingenious Bishop Berkeley, in his Treatise on Vision, a work of great ability, has evinced, that the colours, which we see, are only a language suggesting to our minds the ideas of solidity and extension, which we had before received by the sense of touch. Thus when we view the trunk of a tree, our eye can only acquaint us with the colours or shades; and from the previous experience of the sense of touch, these suggest to us the cylindrical form, with the prominent or depressed wrinkles on it. From hence it appears, that there is the strictest analogy between colours and sounds; as they are both but languages, which do not represent their correspondent ideas, but only suggest them to the mind from the habits or associations of previous experience. It is therefore
reasonable to conclude, that the more artificial arrangements of these two languages by the poet and the painter bear a similar analogy.

But in one circumstance the Pen and the Pencil differ widely from each other, and that is the quantity of Time which they can include in their respective representations. The former can unravel a long series of events, which may constitute the history of days or years; while the latter can exhibit only the actions of a moment. The Poet is happier in describing successive scenes; the Painter in representing stationary ones: both have their advantages.

Where the passions are introduced, as the Poet, on one hand, has the power gradually to prepare the mind of his reader by previous climactic circumstances; the Painter, on the other hand, can throw stronger illumination and distinctness on the principal moment or catastrophe of the action; besides the advantage he has in using an universal language, which can be read in an instant of time. Thus where a great number of figures are all seen together, supporting or contrasting each other, and contributing to explain or aggrandize the principal effect, we view a picture with agreeable surprise, and contemplate it with unceasing admiration. In the representation of the sacrifice of Jephtha’s Daughter, a print done from a painting of Ant. Coypel, at one glance of the eye we read all the interesting passages of the last act of a well-written tragedy; so much poetry is there condensed into a moment of time.

B. Will you now oblige me with an account of the relationship between Poetry, and her other sister, Music?

P. In the poetry of our language I don’t think we are to look for any thing analogous to the notes of the gamut;
for, except perhaps in a few exclamations or interrogations, we are at liberty to raise or sink our voice an octave or two at pleasure, without altering the sense of the words. Hence, if either poetry or prose be read in melodious tones of voice, as is done in recitative, or in chanting, it must depend on the speaker, not on the writer: for though words may be selected which are less harsh than others, that is, which have fewer sudden stops or abrupt consonants among the vowels, or with fewer sibilant letters, yet this does not constitute melody, which consists of agreeable successions of notes referable to the gamut; or harmony, which consists of agreeable combinations of them. If the Chinese language has many words of similar articulation, which yet signify different ideas, when spoken in a higher or lower musical note, as some travellers affirm, it must be capable of much finer effect, in respect to the audible part of poetry, than any language we are acquainted with.

There is however another affinity, in which poetry and music more nearly resemble each other than has generally been understood, and that is in their measure or time. There are but two kinds of time acknowledged in modern music, which are called \textit{triple time}, and \textit{common time}. The former of these is divided by bars, each bar containing three crotchets, or a proportional number of their subdivisions into quavers and semiquavers. This kind of time is analogous to the measure of our heroic or iambic verse. Thus the two following couplets are each of them divided into five bars of \textit{triple time}, each bar consisting of two crotchets and two quavers; nor can they be divided into bars analogous to \textit{common time} without the bars interfering with some of the crotchets, so as to divide them.
3 Soft warbling beaks | in each bright blof | som move,
4 And vo | cal rosebuds thrill | the enchanted grove.—

In these lines there is a quaver and a crochet alternately in every bar, except in the last, in which the in make two semiquavers; the e is supposed by Grammarians to be cut off, which any one's ear will readily determine not to be true.

3 Life buds or breathes | from Indus to | the poles,
4 And the | vaft surface kind | les, as it rolls. |

In these lines there is a quaver and a crotchet alternately in the first bar; a quaver, two crotchets, and a quaver, make the second bar. In the third bar there is a quaver, a crotchet, and a rest after the crotchet, that is, after the word poles, and two quavers begin the next line. The fourth bar consists of quavers and crotchets alternately. In the last bar there is a quaver, and a rest after it, viz. after the word kindles; and then two quavers and a crotchet. You will clearly perceive the truth of this, if you prick the musical characters above mentioned under the verses,

The common time of musicians is divided into bars, each of which contains four crotchets, or a proportional number of their subdivision into quavers and semiquavers. This kind of musical time is analogous to the daëtyle verses of our language, the most popular instances of which are in Mr. Anstie's Bath-Guide. In this kind of verse the bar does not begin till after the first or second syllable; and where the verse is quite complete, and written by a good ear, these first syllables added to the last
complete the bar, exactly in this also corresponding with many pieces of music;

2 Yet | if one may guefs by the | fize of his calf, Sir,
4 He | weighs about twenty three | ftone and a half, Sir.

2 Master | Mamozet's head was not | finifhed fo soon,
4 For it | took up the barber a | whole afternoon.

In these lines each bar confifts of a crotchet, two qua-
vers, another crotchet, and two more quavers: which are equal to four crotchets, and, like many bars of com-
ton time in music, may be subdivided into two in beating
time without disturbing the meafure.

The following verses from Shenftone belong likewise
to common time:

2 A | river or a tea |
4 Was to him a dish | of tea,
- And a king | dom bread and butter.

The first and second bars confift each of a crotchet, a
quaver, a crotchet, a quaver, a crotchet. The third bar
confifts of a quaver, two crotchets, a quaver, a crotchet.
The laft bar is not complete without adding the letter A,
which begins the first line, and then it confifts of a qua-
ver, a crotchet, a quaver, a crotchet, two quavers.

It muft be observed, that the crotchets in triple time
are in general played by musicians flower than thofe of
common time, and hence minuets are generally pricked in
triple time, and country dances generally in common
time. So the verses above related, which are analogous
to triple time, are generally read flower than thofe analo-
gous to common time; and are thence generally used for graver compositions. I suppose all the different kinds of verse to be found in our odes, which have any measure at all, might be arranged under one or other of these two musical times; allowing a note or two sometimes to precede the commencement of the bar, and occasional rests, as in musical compositions: if this was attended to by those who set poetry to music, it is probable the sound and sense would oftner coincide. Whether these musical times can be applied to the lyric and heroic verses of the Greek and Latin poets, I do not pretend to determine; certain it is, that the dactyle verse of our language, when it is ended with a double rhyme, much resembles the measure of Homer and Virgil, except in the length of the lines.

B. Then there is no relationship between the other two of these sister-ladies, Painting and Music?

P. There is at least a mathematical relationship, or perhaps I ought rather to have said a metaphysical relationship between them. Sir Isaac Newton has observed, that the breadths of the seven primary colours in the Sun's image refracted by a prism are proportional to the seven musical notes of the gamut, or to the intervals of the eight sounds contained in an octave, that is, proportional to the following numbers:

Newton's Optics, Book I. part 2. prop. 3 and 6. Dr. Smith, in his Harmonics, has an explanatory note upon this happy discovery, as he terms it, of Newton. Sect. 4. Art. 7.

From this curious coincidence, it has been proposed to produce a luminous music, consisting of succeions or combinations of colours, analogous to a tune in respect to the proportions above mentioned. This might be performed by a strong light, made by means of Mr. Argand's lamps, passing through coloured glasses, and falling on a defined part of a wall, with moveable blinds before them, which might communicate with the keys of a harpsichord; and thus produce at the same time visible and audible music in unison with each other.

The execution of this idea is said by Mr. Guyot to have been attempted by Father Caffel without much success.

If this should be again attempted, there is another curious coincidence between sounds and colours, discovered by Dr. Darwin of Shrewsbury, and explained in a paper on what he calls Ocular Spectra, in the Philosophical Transactions, Vol. LXXVI. which might much facilitate the execution of it. In this treatise the Doctor has demonstrated, that we see certain colours, not only with greater ease and distinctness, but with relief and pleasure, after having for some time contemplated other certain colours; as green after red, or red after green; orange after blue, or blue after orange; yellow after violet, or violet after yellow. This he shews arises from the ocular spectrum of the colour last viewed coinciding with the irritation of the colour now under contemplation. Now as the pleasure we receive from the sensation of melodious notes, independent of the previous associations of agree-
able ideas with them, must arise from our hearing some proportions of sounds after others more easily, distinctly, or agreeably; and as there is a coincidence between the proportions of the primary colours, and the primary sounds, if they may be so called; he argues, that the same laws must govern the sensations of both. In this circumstance, therefore, consists the sisterhood of Music and Painting; and hence they claim a right to borrow metaphors from each other; musicians to speak of the brilliancy of sounds, and the light and shade of a concerto; and painters of the harmony of colours, and the tone of a picture. Thus it was not quite so absurd, as was imagined, when the blind man asked if the colour scarlet was like the sound of a trumpet. As the coincidence or opposition of these ocular specta, (or colours which remain in the eye after having for some time contemplated a luminous object) are more easily and more accurately ascertained, now their laws have been investigated by Dr. Darwin, than the relics of evanescent sounds upon the ear; it is to be wished that some ingenious musician would further cultivate this curious field of science: for if visible music can be agreeably produced, it would be more easy to add sentiment to it by the representations of groves and Cupids, and sleeping nymphs amid the changing colours, than is commonly done by the words of audible music.

B. You mentioned the greater length of the verses of Homer and Virgil. Had not these poets great advantage in the superiority of their languages compared to our own?

P. It is probable, that the introduction of philosophy into a country must gradually affect the language of it;
as philosophy converses in more appropriated and abstracted terms; and thus by degrees eradicates the abundance of metaphor, which is used in the more early ages of society. Otherwise, though the Greek compound words have more vowels in proportion to their consonants than the English ones, yet the modes of compounding them are less general; as may be seen by variety of instances given in the preface of the Translators, prefixed to the System of Vegetables by the Lichfield Society; which happy property of our own language rendered that translation of Linneus as expressive and as concise, perhaps more so than the original.

And in one respect, I believe, the English language serves the purpose of poetry better than the antient ones; I mean in the greater ease of producing personifications; for as our nouns have in general no genders affixed to them in prose-compositions, and in the habits of conversation, they become easily personified only by the addition of a masculine or feminine pronoun, as,

Pale Melancholy fits, and round her throws
A death-like silence, and a dread repose.

Pope's Abelard

And secondly, as most of our nouns have the article a or the prefixed to them in prose-writing and in conversation, they in general become personified even by the omission of these articles; as in the bold figure of Shipwreck in Miss Seward's Elegy on Capt. Cook:

But round the steepy rocks and dangerous strand
Rolls the white surf, and Shipwreck guards the land.
Add to this, that if the verses in our heroic poetry be shorter than those of the antients, our words likewise are shorter; and in respect to their measure or time, which has erroneously been called melody and harmony, I doubt, from what has been said above, whether we are so much inferior as is generally believed; since many passages, which have been stolen from antient poets, have been translated into our language without losing any thing of the beauty of the verification.

B. I am glad to hear you acknowledge the thefts of the modern poets from the antient ones, whose works I suppose have been reckoned lawful plunder in all ages. But have not you borrowed epithets, phrases, and even half a line occasionally from modern poems?

P. It may be difficult to mark the exact boundary of what should be termed plagiarism: where the sentiment and expression are both borrowed without due acknowledgment, there can be no doubt:—single words, on the contrary, taken from other authors, cannot convict a writer of plagiarism; they are lawful game, wild by nature, the property of all who can capture them:—and perhaps a few common flowers of speech may be gathered, as we pass our neighbour’s ineloquence, without stigmatizing us with the title of thieves; but we must not therefore plunder his cultivated fruit.

The four lines at the end of the plant Upas are imitated from Dr. Young’s Night Thoughts. The line in the epistle adjoined to Caffia, “The salt tear mingling with the milk he sips,” is from an interesting and humane passage in Langhorne’s Justice of Peace.
are probably many others, which, if I could recollect them, should here be acknowledged. As it is, like exotic plants, their mixture with the native ones, I hope, adds beauty to my Botanic Garden:—and such as it is, Mr. Bookseller, I now leave it to you to desire the Ladies and Gentlemen to walk in; but please to apprize them, that, like the spectators at an unskilful exhibition in some village-barn, I hope they will make Good-humour one of their party; and thus their selves supply the defects of the representation.
Now the broad Sun his golden orb unshrouds,
Flames in the west, and paints the parted clouds;
O'er heaven's wide arch refracted lustres flow,
And bend in air the many-colour'd bow.—
—The tuneful Goddes on the glowing sky
Fix'd in mute extacy her glistening eye;
And then her lute to sweeter tones she strung,
And swell'd with softer chords the Paphian song.
Long ailes of Oaks return'd the silver sound,
And amorous Echoes talk'd along the ground;
Pleas'd Lichfield listen'd from her sacred bowers,
Bow'd her tall groves, and shook her stately towers.

Pleas'd Lichfield. l. II. The scenery described at the beginning of the
first part, or economy of vegetation, is taken from a botanic garden
about a mile from Lichfield.
"Nymph! not for thee the radiant day returns,
Nymph! not for thee the golden solstice burns,
Refulgent Cerea!—at the dusky hour
She seeks with pensive step the mountain-bower,
Bright as the blush of rising morn, and warms
The dull cold eye of Midnight with her charms.
There to the skies she lifts her pencil'd brows,
Opes her fair lips, and breathes her virgin vows;
Eyes the white zenith; counts the suns, that roll
Their distant fires, and blaze around the Pole;

Cerea. l. 15. Cactus grandiflorus, or Cereus. Twenty males, one
female. This flower is a native of Jamaica and Veracruz. It expands
a most exquisitely beautiful corol, and emits a most fragrant odour for a
few hours in the night, and then closes to open no more. The flower is
nearly a foot in diameter; the inside of the calyx of a splendid yellow,
and the numerous petals of a pure white: it begins to open about seven
or eight o'clock in the evening, and closes before sun-rise in the morn-
ing. Martyn's Letters, p. 294. The Cifus labdiniferus, and many
other flowers, lose their petals after having been a few hours expanded
in the day-time; for in these plants the stigma is soon impregnated by
the numerous anthers: in many flowers of the Cifus labdiniferus I ob-
served two or three of the stamens were perpetually bent into contact
with the pistil.

The Nyctanthes, called Arabian Jasmine, is another flower, which
expands a beautiful corol, and gives out a most delicate perfume during
the night, and not in the day, in its native country, whence its name;
botanical philosophers have not yet explained this wonderful property;
perhaps the plant sleeps during the day as some animals do; and its odor-
riferous glands only emit their fragrance during the expansion of the
petals; that is, during its waking hours: the Geranium trifite has the
same property of giving up its fragrance only in the night. The flowers
of the Cucurbita lagenaria are said to close when the sun shines upon
them. In our climate many flowers, as tragopogon, and hibiscus, close
their flowers before the hottest part of the day comes on; and the flow-
ers of some species of cucubalus, and Silene, viscous campion, are closed
all day; but when the sun leaves them they expand, and emit a very
agreeable scent; whence such plants are termed noctiflora.
Or marks where Jove directs his glittering car
O'er Heaven's blue vault,—Herself a brighter star.
—There as soft Zephyrs sweep with pausing airs
Thy snowy neck, and part thy shadowy hairs,
Sweet Maid of Night! to Cynthia's sober beams
Glows thy warm cheek, thy polish'd bosom gleams,
In crowds around thee gaze the admiring swains,
And guard in silence the enchanted plains;
Drop the still tear, or breathe the impassion'd sigh,
And drink inebriate rapture from thine eye.
Thus, when old Needwood's hoary scenes the Night
Paints with blue shadow, and with milky light;
Where Mundy pour'd, the listening nymphs among,
Loud to the echoing vales his parting song;
With measured step the Fairy Sovereign treads,
Shakes her high plume, and glitters o'er the meads;
Round each green holly leads her sportive train,
And little footsteps mark the circled plain;
Each haunting rill with silver voices rings,
And Night's sweet bird in livelier accents sings.

Ere the bright star, which leads the morning sky,
Hangs o'er the blushing east his diamond eye,
The chaff-tropeo leaves her secret bed;
And faint-like glory trembles round her head;

Where Mundy. l. 35. Alluding to an unpublished poem by F. N. Mundy, Esq. on his leaving Needwood-Forest.

Tropeoolum. l. 45. Majus. Garden Nauturion, or greater Indian crees.
Eight males, one female. Miss E. C. Linnaeus first observed the Tropeoolum Majus to emit sparks or flashes in the mornings before sunrife, during the months of June or July, and also during the twilight in the evening, but not after total darkness came on; these singular scintillations were shewn to her father and other philosophers; and Mr. Wilcke, a celebrated electrician, believed them to be electric. Lin. Spec. Plantar.
Rear'd a vast pyre before the golden shrine
Of sulphurous coal, and pitch-exuding pine;—
—Loud roar the flames, the iron nostrils breathe,
And the huge bellows pant and heave beneath;
Bright and more bright the blazing deluge flows,
And white with seven-fold heat the furnace glows.
And now the Monarch fix'd with dread surprise,
Deep in the burning vault his dazzled eyes.

"Lo! Three unbound amid the frightful glare,
Unscorch'd their scalds, and unsing'd their hair!
And now a fourth with seraph-beauty bright
Descends, accosts them, and outshines the light!
Fierce flames innocuous, as they step, retire!
And flow they move amid a world of fire!"
He spoke,—to Heaven his arms repentant spread,
And kneeling bow'd his gem-incircled head.

Two Sister-Nymphs, the fair Avenas, lead
Their fleecy squadrons on the lawns of Tweed;

Avena. l. 73. Oat. The numerous families of grasses have all three males, and two females, except Anthoxanthum, which gives the grateful smell to hay, and has but two males. The herbs of this order of vegetables support the countless tribes of graminivorous animals. The seeds of the smaller kinds of grasses, as of airo, poa, briza, flipa, &c, are the sustenance of many sorts of birds. The seeds of the large grasses, as of wheat, barley, rye, oats, supply food to the human species.

It seems to have required more ingenuity to think of feeding nations of mankind with so small a seed, than with the potato of Mexico, or the bread-fruit of the southern islands; hence Ceres in Egypt, which was the birth-place of our European arts, was deservedly celebrated amongst their divinities, as well as Osyris, who invented the Plough.

Mr. Wahlborn observes, that as wheat, rye, and many of the grasses, and plantain, lift up their anthers on long filaments, and thus expose the enclosed fecundating dust to be washed away by the rains, a scarcity of corn is produced by wet summers; hence the necessity of a careful
Pafs with light step his wave-worn banks along,
And wake his Echoes with their silver tongue;
Or touch the reed, as gentle Love inspires,
In notes accordant to their chaste desires.

I.
"Sweet Echo! sleepest thy vocal shell,
"Where this high arch o'erhangs the dell;
"While Tweed with sun-reflecting streams
"Chequers thy rocks with dancing beams?—

II.
"Here may no clamours harsh intrude,
"No brawling hound or clarion rude;
"Here no fell beast of midnight prowl,
"And teach thy tortured cliffs to howl!

III.
"Be thine to pour these vales along
"Some artless Shepherd's evening song;
"While Night's sweet bird, from yon high spray
"Responsive, listens to his lay.

IV.
"And if, like me, some love-lorn maid
"Should sing her forrows to thy shade,
"Oh, sooth her breast, ye rocks around!
"With softest sympathy of sound."

choice of seed-wheat, as that, which had not received the dust of the anthers, will not grow, though it may appear well to the eye. The straw of the oat seems to have been the first musical instrument, invented during the pastoral ages of the world, before the discovery of metals. See note on Ciftus.
From ozier bowers the brooding Halcyons peep,
The Swans pursuing cleave the glassy deep,
On hovering wings the wondering Reed-larks play,
And silent Bitterns listen to the lay.

Three Shepherd-swains beneath the beechen shades
Twine rival garlands for the tuneful maids;
On each smooth bark the mystic love-knot frame,
Or on white sands inscribe the favour'd name.

Green swells the beech, the widening knots improve,
So spread the tender growths of cultur'd love;
Wave follows wave, the letter'd lines decay,
So Love's soft forms neglected melt away.

From Times remotest dawn where China brings
In proud succession all her Patriot-Kings;
O'er desert-sands, deep gulfs, and hills sublime,
Extends her massy wall from clime to clime.

With bells and dragons crefts her Pagod-bowers,
Her silken palaces, and porcelain towers;
With long canals a thousand nations laves;
Plants all her wilds, and peoples all her waves.

Slow treads fair Cannabis the breezy strand,
The distaff streams dishevell'd in her hand;

Cannabis. 1. 111. Chinese Hemp. Two houses. Five males. A new species of hemp, of which an account is given by K. Fitzgerald, Esq., in a letter to Sir Joseph Banks, and which is believed to be much superior to the hemp of other countries. A few seeds of this plant were sown in England on the 4th of June, and grew to fourteen feet seven inches in height by the middle of October; they were nearly seven inches in circumference, and bore many lateral branches, and produced very white and tough fibres. At some parts of the time these plants grew nearly eleven inches in a week. Philos. Trans. Vol. I. XXII. p. 46.
Now to the left her ivory neck inclines,
And leads in Paphian curves its azure lines;
Dark waves the fringed lid, the warm cheek glows,
And the fair ear the parting locks disclose;
Now to the right with airy sweep the bends,
Quick join the threads, the dancing spole depends.
—Five Swains attracted guard the Nymph, by turns
Her grace enchant's them, and her beauty burns;
To each She bows with sweet assuitive smile,
Hears his soft vows, and turns her spole the while.

So when with light and shade, concordant strive!
Stern Clotho weaves the chequer'd thread of life;
Hour after hour the growing line extends,
The cradle and the coffin bound its ends;
Soft cords of silk the whirling spoles reveal,
If smiling Fortune turn the giddy wheel;
But if sweet Love with baby-fingers twines,
And wets with dewy lips the lengthening lines,
Skein after skein celestial tints unfold,
And all the silken tissue shines with gold.

Warm with sweet blushes bright Galantha glows,
And prints with frolic step the melting snows;

Paphian Curves. I. 114. In his ingenious work, intitled, The Analysis of Beauty, Mr. Hogarth believes that the triangular glafs, which was dedicated to Venus in her temple at Paphos, contained in it a line bending spirally round a cone with a certain degree of curvature; and that this pyramidal outline and serpentine curve constitute the principles of Grace and Beauty.

Galanthus. I. 133. Nivalis. Snowdrop. Six males, one female. The first flower that appears after the winter solstice. See Stillingfleet's Calendar of Flora.
O'er silent floods, white hills, and glittering meads
Six rival Swains the playful beauty leads,
Chides with her dulcet voice the tardy Spring,
Bids flumbering Zephyr stretch his folded wing,
Wakes the hoarse Cuckoo in his gloomy cave,
And calls the wondering Dormouse from his grave,
Bids the mute Redbreast cheer the budding grove,
And plaintive Ringdove tune her notes to love.

Spring! with thy own sweet smile, and tuneful tongue
Delightful Bellis calls her infant throng.

Some snowdrop-roots taken up in winter, and boiled, had the insipid
mucilaginous taste of the Orchis, and, if cured in the same manner,
would probably make as good false. The roots of the Hyacinth, I am
informed, are equally insipid, and might be used as an article of food.
Gmelin, in his History of Siberia, says the Martigon Lily makes a part
of the food of that country, which is of the same natural order as the
snowdrop. Some roots of Crocus, which I boiled, had a disagreeable
flavour.

The difficulty of raising the Orchis from seed has, perhaps, been a
principal reason of its not being cultivated in this country as an article
of food. It is affirmed, by one of the Linnean school, in the Amœnit.
Academ. that the seeds of Orchis will ripen, if you destroy the new
bulb; and that Lily of the Valley, Convallaria, will produce many
more seeds, and ripen them, if the roots be crowded in a garden pot, so
as to prevent them from producing many bulbs. Vol. VI. p. 120. It
is probable either of these methods may succeed with these and other
bulbous-rooted plants, as snowdrops, and might render their cultivation
profitable in this climate. The root of the asphodelus ramosus, branchy
asphodel, is used to feed swine in France; and starch is obtained from
the alstromeria licha. Memoires d'Agricult.

Bellis prolifer's, l. 144. Hen and chicken Daisy; in this beautiful
monster not only the impalement or doubling of the petals takes place, as
described in the note on Alcea; but a numerous circlet of feft flowers
on peduncles, or footstalks, rise from the sides of the calyx, and sur-
round the prolific parent. The fame occurs in Calendula, marigold;
in Heracium, hawk-weed; and in Scabiosa, Scabious. Phil. Botan.
p. 82.
Each on his reed a'bride; the Cherub-train Watch her kind looks, and circle o'er the plain; Now with young wonder touch the sliding snail, Admire his eye-tipp'd horns, and painted mail; Chafe with quick step, and eager arms outspread, The pausing Butterfly from mead to mead; Or twine green oziers with the fragrant gale, The azure harebel, and the primrose pale, Join hand in hand, and in procession gay Adorn with votive wreaths the shrine of May. —So moves the Goddess to the Idalian groves, And leads her gold-hair'd family of Loves. These, from the flaming furnace, strong and bold Pour the red steel into the sandy mould; On tinkling anvils (with Vulcanian art), Turn with hot tongs, and forge the dreadful dart; The barbed head on whirling jaspers grind, And dip the point in poison for the mind; Each polish'd shaft with snow-white plumage wing, Or strain the bow reluctant to its string, Those on light pinion twine with busy hands, Or stretch from bough to bough the flowery bands;

Du Halde gives an account of a white wax made by small insects round the branches of a tree in China in great quantity, which is there collected for economical and medical purposes: the tree is called Tong-tsin. Description of China, Vol. I. p. 230.

The fragrant Gale. l. 151. The buds of the Myrica Gale posses an agreeable aromatic fragrance, and might be worth attending to as an article of the Materia Medica. Mr. Sparman suspects, that the green wax-like substance, with which at certain times of the year the berries of the Myrica cerifera, or candle berry Myrtle, are covered, are deposited there by insects. It is used by the inhabitants for making candles, which he says burn rather better than those made of tallow. Voyage to the Cape, Vol. I. 345.
(128)

Scare the dark beetle, as he wheels on high,
Or catch in silken nets the gilded fly;
Call the young Zephyrs to their fragrant bowers,
And stay with kisles sweet the Vernal Hours.

Where, as proud Maffon rises rude and bleak,
And with mishapen turrets crefts the Peak,
Old Matlock gapes with marble jaws, beneath,
And o'er scar'd Derwent bends his flinty teeth;
Deep in wide caves below the dangerous foil
Blue sulphurs flame, imprison'd waters boil.

Deep in wide caves. L. 175. The arguments which tend to shew that the warm springs of this country are produced from steam raised by deep subterraneous fires, and afterwards condenfed between the strata of the mountains, appear to me more much more conclusive, than the idea of their being warmed by chemical combinations near the surface of the earth: for, 1st, their heat has kept accurately the fame perhaps for many centuries, certainly as long as we have been possessed of good thermometers; which cannot be well explained, without supposing that they are first in a boiling state. For as the heat of boiling water is 212, and that of the internal parts of the earth 48, it is easy to understand, that the steam raised from boiling water, after being condenfed in some mountain, and passing from thence through a certain space of the cold earth, must be cooled always to a given degree; and it is probable the distance from the exit of the spring, to the place where the steam is condenfed, might be guessed by the degree of its warmth.

2. In the dry summer of 1780, when all other springs were either dry or much diminished, those of Buxton and Matlock (as I was well informed on the spot), had suffered no diminution; which proves that the sources of these warm springs are at great depths below the surface of the earth.

3. There are numerous perpendicular fissures in the rocks of Derbyshire, in which the ores of lead and copper are found, and which pass to unknown depths; and might thence afford a passage to steam from great subterraneous fires.

4. If these waters were heated by the decomposition of pyrites, there would be some chalybeate taste or sulphureous smell in them. See note in part 1. on the existence of central fires.
Impetuous flames in spiry columns rise
Through rifted rocks, impatient for the skies;
Or o'er bright seas of bubbling lavas blow,
As heave and toss the billowy fires below;
Condensed on high, in wandering rills they glide
From Masson's dome, and burst his sparpy side;
Round his grey towers, and down his fringed walls,
From cliff to cliff, the liquid treasure falls;
In beds of stalacmite, bright ores among,
O'er corals, shells, and crystals, winds along;
Crufts the green mosses, and the tangled wood.
And sparkling plunges to its parent flood.
—O'er the warm wave a smiling youth presides,
Attunes its murmurs, its meanders guides,
(The blooming Fucus), in her sparry coves
To amorous Echo sings his secret loves.

Fucus. l. 191. Clandestine marriage. A species of Fucus, or of Con-fera, soon appears in all basins which contain water. Dr. Priestley found that great quantities of pure dephlogisticated air were given up in water at the points of this vegetable, particularly in the sunshine, and that hence it contributed to preserve the water in reservoirs from becoming putrid. The minute divisions of the leaves of subaquatic plants, as mentioned in the note on Trapa, and of the gills of fish, seem to serve another purpose besides that of increasing their surface, which has not, I believe, been attended to, and that is to facilitate the separation of the air, which is mechanically mixed or chemically dissolved in water by their points or edges; this appears on immersing a dry hairy leaf in water fresh from a pump; innumerable globules like quicksilver appear on almost every point; for the extremities of these points attract the particles of water less forcibly than those particles attract each other; hence the contained air, whose elasticity was but just balanced by the attractive power of the surrounding particles of water to each other, finds at the point of each fibre a place where the ressistance to its expansion is less; and in consequence it there expands, and becomes a bubble of air. It is easy to foresee that the rays of the sunshine, by being refracted and in part reflected by the two surfaces of these minute air-bubbles,
Bathes his fair forehead in the misty stream,
And with sweet breath perfumes the rising stream.
—So, erst, an Angel o'er Betheda's springs,
Each morn descending, shook his dewy wings;
And as his bright translucent form He laves,
Salubrious powers enrich the troubled waves.

Amphibious Nymph, from Nile's prolific bed
Emerging Trapa lifts her pearly head;

must impart to them much more heat than to the transparent water;
and thus facilitate their ascent by further expanding them; that the
points of vegetables attract the particles of water less than they attract
each other, is seen by the spherical form of dew-drops on the points of
grafs. See note on Vegetable Representation in Part I.

Trapa. I. 200. Four males, one female. The lower leaves of this
plant grow under water, and are divided into minute capillary ramifications; while the upper leaves are broad and round, and have air-bladders in their footstalks to support them above the surface of the water.

As the aerial leaves of vegetables do the office of lungs, by exposing a
large surface of vessels with their contained fluids to the influence of the
air; so these aquatic leaves answer a similar purpose like the gills of fish;
and perhaps gain from water or give to it a similar material. As the
material thus necessary to life seems to abound more in air than in water,
the subaquatic leaves of this plant, and of Siphymbrum, Ceaath, ranunculus aquatilis, water crowsfoot, and some others, are cut into fine divisions to increase the surface; whilst those above water are undivided.

So the plants on high mountains have their upper leaves more divided,
as pimpinella, Petroelinum, and others, because here the air is thinner,
and thence a larger surface of contact is required. The stream of water also passes but once along the gills of fish, as it is sooner deprived of its virtue; whereas the air is both received and ejected by the action of the lungs of land-animals. The whale seems to be an exception to the above, as he receives water and spouts it out again from an organ, which I suppose to be a respiratory one. As spring-water is nearly of the same degree of heat in all climates, the aquatic plants, which grow in rills or fountains, are found equally in the torrid, temperate, and frigid zones, as water-cresfs, water-parsnip, ranunculus, and many others.
(131)

Fair glows her virgin cheek and modest breast,
A panoply of scales deforms the rest;
Her quivering fins and panting gills she hides,
But spreads her silver arms upon the tides;
Slow as she fails, her ivory neck she laves,
And shakes her golden tresses o'er the waves.
Charm'd round the Nymph, in circling gambols glide
*Four Nereid-forms*, or shoot along the tide;
Now all as one they rise with frolic spring,
And beat the wondering air on humid wing;
Now all descending plunge beneath the main,
And lash the foam with undulating train;
Above, below, they wheel, retreat, advance,
In air and ocean weave the mazy dance;
Bow their quick heads, and point their diamond eyes,
And twinkle to the sun with ever-changing dyes.

*Where Andes, crested with volcanic beams,*
Sheds a long line of light on Plata's streams;
Opes all his springs, unlocks his golden caves,
And feeds and freights the immeasurable waves;

In warmer climates the watery grounds are usefully cultivated, as
with rice; and the roots of some aquatic plants are said to have supplied
food, as the ancient *Lotus* in Egypt, which some have supposed to be
the *Nymphaea.*—In Siberia the roots of the Butomus, or flowering rush,
are eaten, which is well worth further enquiry, as they grow spontaneously
in our ditches and rivers, which at present produce no esculent vegetables;
and might thence become an article of useful cultivation. *Herodotus* affirms,
that the Egyptian Lotus grows in the Nile, and resembles a Lily. That the natives dry it in the sun, and take the pulp
out of it, which grows like the head of a poppy, and bake it for bread.
Enterpe. Many grit-stones and coals, which I have seen, seem to bear
an impression of the roots of the *Nymphaea*, which are often three or
four inches thick, especially the white-flowered one.
Delighted Ocyama at twilight hours
Calls her light ear, and leaves the fultry bowers;—
Love's rising ray, and Youth's seductive dye,
Bloom'd on her cheek, and bright'en'd in her eye;
Chaste, pure, and white, a zone of silver graced
Her tender breast, as white, as pure, as chaste;—
By four fond swains in playful circles drawn,
On glowing wheels she tracks the moon-bright lawn,

Ocynum salinum. l. 221. Saline Basil. Class Two Powers. The Abbé Molina, in his History of Chili, translated from the Italian by the Abbé Grewel, mentions a species of Basil which he calls Ocynum salinum: he says it resembles the common basil, except that the stalk is round and jointed; and that though it grows 60 miles from the sea, yet every morning it is covered with saline globules, which are hard and splendid, appearing at a distance like dew; and that each plant furnishes about half an ounce of fine salt every day, which the peasants collect, and use as common salt, but esteem it superior in flavour.

As an article of diet, salt seems to act simply as a stimulus, not containing any nourishment, and is the only fossil substance which the price of mankind has yet taken into their stomachs along with their food; and, like all other unnatural stimuli, is not necessary to people in health, and contributes to weaken our system; though it may be useful as a medicine. It seems to be the immediate cause of the sea scurvy, as those patients quickly recover by the use of fresh provisions; and is probably a remote cause of scrophula (which consists in the want of irritability in the absorbent vessels), and is therefore serviceable to these patients; as wine is necessary to those whose stomachs have been weakened by its use. The universality of the use of salt with our food, and in our cookery, has rendered it difficult to prove the truth of these observations. I suspect that flesh-meat cut into thin slices, either raw or boiled, might be preferred in coarse sugar or treacle; and thus a very nourishing and salutary diet might be presented to our seamen. See note on Salt-rocks, in Vol. I. Canto II. If a person unaccustomed to much salt should eat a couple of red-herrings, his insensible perspiration will be so much increased by the stimulus of the salt, that he will find it necessary in about two hours to drink a quart of water: the effects of a continued use of salt in weakening the action of the lymphatic system may hence be deduced.
Mounts the rude cliff, unveils her blushing charms,
And calls the panting zephyrs to her arms,
Emerged from ocean springs the vaporous air,
Bathes her light limbs, uncurls her amber hair,
Incrusts her beamy form with films saline,
And Beauty blazes through the crystal shrine.—
So with pellucid studs the ice-flower gems
Her rimy foliage, and her candied stems.
So from his glassy horns, and pearly eyes,
The diamond-beetle darts a thousand dyes;
Mounts with enamel'd wings the vesper gale,
And wheeling shines in adamantine mail.

Thus when loud thunders o'er Gomorrah burst,
And heaving earthquakes shook his realms accurst,
An Angel-guest led forth the trembling Fair
With shadowy hand, and warn'd the guiltless pair;
"Haste from these lands of sin, ye Righteous! fly,
"Speed the quick step, nor turn the lingering eye!"—
—Such the command, as fabling Bards indite,
When Orpheus charm'd the grizzly King of Night,
Sooth'd the pale phantoms with his plaintive lay,
And led the fair Assurgent into day.—
Wide yawn'd the earth, the fiery tempest flash'd,
And towns and towers in one vast ruin crash'd;
Onward they move,—loud horror roars behind,
And shrieks of Anguist bellow in the wind.
With many a sob, amid a thousand fears,
The beauteous wanderer pours her gushing tears;
Each soft connection rends her troubled breast,
—She turns, unconscious of the stern behest!—

Ice-flower I, 235. Mefembryanthenum crystallinum.
I faint!—I fall!—ah, me!—sensations chill
Shoot through my bones, my shuddering bosom thrill!
If freeze! I freeze! just Heaven regards my fault, 261
Numbs my cold limbs, and hardens into falt!—
Not yet, not yet, your dying Love refrain!—
This last, last kiss receive!—no longer thine!—
She said, and ceased,—her stiffen'd form He press'd, 265
And strain'd the briny column to his breast;
Printed with quivering lips the lifeless snow,
And wept, and gazed the monument of woe.——
So when Æneas through the flames of Troy
Bore his pale fire, and led his lovely boy,
With loitering step the fair Creusa stay'd,
And Death involved her in eternal shade.——
—Oft the long Pilgrim, that his road forsakes,
Marks the wide ruins, and the sulphur'd lakes;]
On mouldering piles amid asphaltic mud
Hears the hoarse bittern, where Gomorrah stood:
Recalls the unhappy Pair with lifted eye,
Leans on the crystal tomb, and breathes the silent sigh.

With net-wove fash and glittering gorget dres'd,
And scarlet robe lapell'd upon her breast,
Stern ARA frowns, the measured march assumes,
Trails her long lance, and nods her shawowy plumes;

Arum. I. 281. Cuckow-pint, of the class Gynandria, or masculine ladies. The pistil, or female part of the flower, rises like a club, is covered above or clothed, as it were, by the anthers or males; and some of the species have a large scarlet blotch in the middle of every loaf.
The singular and wonderful structure of this flower has occasioned many disputes amongst botanists. See Tourniff. Malpig. Dillen. Rivin. &c. The receptacle is enlarged into a naked club, with the germs at its base; the stamens are affixed to the receptacle amidst the germs (a natural prodigy), and thus do not need the assistance of elevating fila-
While Love's soft beams illumine her treacherous eyes,
And Beauty lightens through the thin disguise.
So erst, when Hercules, untamed by toil,
Own'd the soft power of Dejanira's smile;—
His lion-spoils the laughing Fair demands,
And gives the distaff to his awkward hands;
O'er her white neck the bristly mane he throws,
And binds the gaping whiskers on her brows;
Plaits round her slender waist the slaty vest,
And clasps the velvet paws across her breast.
Next with soft hands the knotted club he rears,
Heaves up from earth, and on her shoulders bears.
Onward with loftier step the Beauty treads,
And trails the brinded ermine o'er the meads;
Wolves, bears, and bards, forfake the affrighted groves,
And grinning Satyrs tremble, as she moves.

Ments: hence the flower may be said to be inverted. "Families of Plants" translated from Linneus, 618.

The spadix of this plant is frequently quite white, or coloured, and the leaves liable to be streaked with white, and to have black or scarlet blotches on them. As the plant has no corol or blossom, it is probable the coloured juices in these parts of the sheath or leaves may serve the same purpose as the coloured juices in the petals of other flowers; from which I suppose the honey to be prepared. See note on Helleborus. I am informed that those tulip roots which have a red cuticle produce red flowers. See Rubia.

When the petals of the tulip become striped with many colours, the plant loses almost half of its height; and the method of making them thus break into colours is by transplanting them into a meagre or sandy soil, after they have previously enjoyed a richer soil: hence it appears, that the plant is weakened when the flower becomes variegated. See note on Anemone. For the acquired habits of vegetables, see Tulipa, Orchis.

The roots of the Arum are scratched up and eaten by thrushes in severe snowy seasons. White's Hist. of Selbourne, p. 43.
Caryo's sweet smile Dianthus proud admires,
And gazing burns with unallow'd desires;
With sighs and sorrows her compassion moves,
And wins the damsel to illicit loves.

Dianthus, l. 299. Superbus. Proud Pink. There is a kind of pink called Fairchild's mule, which is here supposed to be produced between a Dianthus superbus, and the Caryophyllus, Clove. The Dianthus superbus emits a most fragrant odour, particularly at night. Vegetable mules supply an irrefragable argument in favour of the sexual system of botany. They are said to be numerous; and, like the mules of the animal kingdom, not always to continue their species by seed. There is an account of a curious mule from the Antirrhinum linaria, Toad-flax, in the Amoenit. Academ. V. I. No. 3; and many hybrid plants described in No. 32. The Urtica alienata is an evergreen plant, which appears to be a nettle from the male flowers, and a Pellitory (Parietaria) from the female ones and the fruit; and is hence between both. Murray, SyfL Veg. Amongst the English indigenous plants, the veronica hybrid mule Speedwel is supposed to have originated from the officinal one; and the spiked one, and the Sibthorbia Europæa to have for its parents the golden faxifrage and marsh pennywort. Pulteney's View of Linneas, p. 250. Mr. Grabeig, Mr. Schreber, and Mr. Ramftrom, seem of opinion, that the internal structure or parts of fructification in mule-plants resemble the female parent; but that the habit or external structure resembles the male parent. See treatises under the above names in V. VI. Amoenit. Academic. The mule produced from a horse and the ass resembles the horse externally with his ears, mane, and tail; but with the nature or manners of an ass: but the Hinnus, or creature produced from a male ass, and a mare, resembles the father externally in stature, ash-colour, and the black cross, but with the nature or manners of a horse. The breed from Spanish rams and Swedish ewes resembled the Spanish sheep in wool, stature, and external form; but was as hardy as the Swedish sheep; and the contrary of those which were produced from Swedish rams and Spanish ewes. The offspring from the male goat of Angora and the Swedish female goat had long soft camel's hair; but that from the male Swedish goat, and the female one of Angora, had no improvement of their wool. An English ram without horns, and a Swedish horned ewe, produced sheep without horns. Amen. Academ. V, VI. p. 13.
The Monster-offspring heirs the father's pride,
Musk'd in the damask beauties of the bride.

So, when the Nightingale in eastern bowers
On quivering pinion woos the Queen of flowers;
Inhales her fragrance, as he hangs in air,
And melts with melody the blushing fair;
Half-rose, half-bird, a beauteous Monster springs,
Waves his thin leaves, and claps his glossy wings;
Long horrent thorns his mossy legs surround,
And tendril-talons root him to the ground;
Green films of rind his wrinkled neck o'erspread,
And crimfon petals crest his curled head;
Soft-warbling beaks in each bright blossom move,
And vocal Rosebuds thrill the enchanted grove!—
Admiring Evening stays her beamy star,
And still Night liftens from his ebon car;
While on white wings descending Houries throng,
And drink the floods of odour and of song.

When from his golden urn the Solstice pours
O'er Afric's fable sons the fultry hours;
When not a gale flits o'er her tawny hills,
Save where the dry Harmattan breathes and kills;

*The dry Harmattan.* l. 324. The Harmattan is a singular wind blowing from the interior parts of Africa to the Atlantic ocean, sometimes for a few hours, sometimes for several days without regular periods. It is always attended with a fog or haze, so dense as to render those objects invisible which are at the distance of a quarter of a mile; the sun appears through it only about noon, and then of a dilute-red, and very minute particles subside from the misty air so as to make the grass, and the skins of negroes appear whitish. The extreme dryness which attends this wind or fog, without dews, withers and quite dries the leaves of vegetables; and is said by Dr. Lind at some seasons to be fatal and malignant to mankind; probably after much preceding wet, when it may become loaded with the exhalation from putrid marshes; at other
When stretch'd in dust her gasping panthers lie,
And writh'd in foamy folds her serpents die;
Indignant Atlas mourns his leafless woods,
And Gambia trembles for his sinking floods;
Contagion stalks along the briny sand,
And Ocean rolls his sickening shoals to land.

seasons it is said to check epidemic diseases, to cure fluxes, and to heal ulcers and cutaneous eruptions; which is probably effected by its yielding no moisture to the mouth of the external absorbent vessels, by which the action of the other branches of the absorbent system is increased to supply the deficiency. Account of the Harmattan. Phil. Transafs. V. LXXXI.

The Rev. Mr. Sterling gives an account of a darkness for six or eight hours at Detroit in America, on the 19th of October, 1762, in which the sun appeared as red as blood, and thence its usual size: some rain falling, covered white paper with dark drops, like sulphur, or dirt, which burnt like wet gunpowder, and the air had a very sulphurous smell. He supposes this to have been emitted from some distant earthquake or volcano. Philos. Trans. V. 1. III. p. 63.

In many circumstances this wind seems much to resemble the dry fog which covered most parts of Europe for many weeks in the summer of 1780, which has been supposed to have had a volcanic origin, as it succeeded the violent eruption of Mount Hecla, and its neighbourhood. From the subidence of a white powder, it seems probable that the Harmattan has a similar origin, from the unexplored mountains of Africa. Nor is it improbable, that the epidemic coughs, which occasionally traverse immense tracts of country, may be the products of volcanic eruptions; nor impossible, that at some future time contagious miasmas may be thus emitted from subterraneous furnaces, in such abundance as to contaminate the whole atmosphere, and depopulate the earth!

His sickening shoals. L. 330. Mr. Marfden relates, that in the island of Sumatra, during the November of 1775, the dry monsoons, or S. E. winds, continued so much longer than usual, that the large rivers became dry; and prodigious quantities of sea-fish, dead and dying, were seen floating for leagues on the sea, and driven on the beach by the tides. This was supposed to have been caused by the great evaporation, and the deficiency of fresh water rivers having rendered the sea too salt for its inhabitants. The season then became so sickly as to destroy great
—Fair CHUNDA smiles amid the burning waste,  
Her brow unturban'd, and her zone unbracl'd;  
Ten brother-youths with light umbrella's shade,  
Or fan with busy hands the panting maid;  
Loose wave her locks, disclosing as they break,  
The rising bosom and averted cheek;  
Clap'd round her ivory neck with studs of gold  
Flows her thin vest in many a gauzy fold;  
O'er her light limbs the dim transparence plays,  
And the fair form, it seems to hide, betrays.  

Where leads the northern Star his lucid train  
High o'er the snow-clad earth, and icy main,  
With milky light the white horizon streams,  
And to the moon each sparkling mountain gleams.—

numbers of people, both foreigners and natives. Phil. Transf. V.  
LXXI. p. 584.

Chunla. l. 331. Chundali Borrum is the name which the natives give  
to this plant; it is the Hedyfarum gyrians, or moving plant; its class is  
two brotherhoods, ten males. Its leaves are continually in spontaneous  
motion; some rising and others falling; and others whirling circularly  
by twisting their stems; this spontaneous movement of the leaves, when  
the air is quite still and very warm, seems to be necessary to the plant,  
as perpetual respiration is to animal life. A more particular account,  
with a good print of the Hedyfarum gyrians is given by M. Broullonet  
in a paper on vegetable motions in the Histoire de l’Academie des  

There are many other instances of spontaneous movements of the  
parts of vegetables. In the Marchantia polymorpha some yellow wool  
proceeds from the flower-bearing anthers, which moves spontaneously  
in the anther, while it drops its dust like atoms. Murray, Syll. Veg.  
See note on Collinsonia for other instances of vegetable spontaneity.  
Add to this, that as the sleep of animals consists in a suspension of vo-  
luntary motion, and as vegetables are likewise subject to sleep, there is  
reason to conclude, that the various actions of opening and closing their  
petals and foliage may be justly ascribed to a voluntary power: for  
without the faculty of volition, sleep would not have been necessary to  
them.
Slow o'er the printed snows with silent walk
Huge shaggy forms across the twilight stalk;
And ever and anon with hideous sound
Burst the thick ribs of ice, and thunder round.—
There, as old Winter flaps his hoary wing,
And lingering leaves his empire to the Spring,
Pierced with quick shafts of silver-flooting light
Fly in dark troops the dazzled imps of night.—

"Awake, my Love!" enamour'd Muschus cries,
"Stretch thy fair limbs, resplendent Maid! arise;
"Ope thy sweet eye-lids to the rising ray,
"And hail with ruby lips returning day.
"Down the white hill dissolving torrents pour,
"Green springs the turf, and purple blows the flower;

_Burft the thick ribs of ice._ l. 348. The violent cracks of ice heard from the Glaciers seem to be caused by some of the snow being melted in the middle of the day; and the water thus produced running down into valleys of ice, and congealing again in a few hours, forces off by its expansion large precipices from the ice-mountains.

_Muschus._ l. 353. Corallinus, or lichen rangiferinus. Coral-moss. Clandestine-marriage. This moss vegetates beneath the snow, where the degree of heat is always about 40; that is, in the middle between the freezing point, and the common heat of the earth; and is for many months of the winter the sole food of the reindeer, who digs furrows in the snow to find it: and as the milk and flesh of this animal is almost the only sustenance which can be procured during the long winters of the higher latitudes, this moss may be said to support some millions of mankind.

The quick vegetation that occurs on the solution of the snows in high latitudes appears very astonishing; it seems to arise from two causes, 1. the long continuance of the approaching sun above the horizon; 2. the increased irritability of plants which have been long exposed to the cold. See note on Anemone.

All the water-fowl on the lakes of Siberia are said by Professor Gmelin to retreat southwards on the commencement of the frosts, except the Rail, which sleeps buried in the snow. _Account of Siberia._
"His torpid wing the Rail exulting tries,
Mounts the soft gale, and wantons in the skies;
Rise, let us mark how bloom the awaken'd groves,
And 'mid the banks of roses hide our loves."

Night's tinfoil beams on smooth Lock-lomond dance,
Impatient Aega views the bright expanse;
In vain her eyes the passing floods explore,
Wave after wave rolls freightless to the shore.
—Now dim amid the distant foam she spies
A rising speck,—"'tis he! 'tis he!" she cries;
As with firm arms he beats the streams aside,
And cleaves with rising chest the toffing tide,
With bended knee she prints the humid sands,
Up-turns her glistering eyes, and spreds her hands;
—"'Tis he, 'tis he!—My Lord, my life, my love!—
Slumber, ye winds; ye billows, cease to move!
Beneath his arms your buoyant plumage spread,
Ye Swans! ye Halcyons! hover round his head!—
With eager step the boiling surf she braves,
And meets her refluent lover in the waves;
Loose o'er the flood her azure mantle swims,
And the clear stream betrays her snowy limbs.

So on her sea-girt tower fair Hero stood
At parting day, and mark'd the dashing flood;

Aega. l. 364. Conferva æagropila. It is found loose in many lakes
in a globular form, from the size of a walnut to that of a melon, much
resembling the balls of hair found in the stomachs of cows; it adheres to
nothing, but rolls from one part of the lake to another. The Conferva
vagabunda dwells on the European seas, travelling along in the midst of
the waves; (Spec. Plant.) These may not improperly be called itinerant vegetables.
In a similar manner the Fucus natans (swimming)
strikes no roots into the earth, but floats on the sea in very extensive
masses, and may be said to be a plant of passage, as it is wafted by the
winds from one shore to another.
While high in air, the glimmering rocks above,
Shone the bright lamp, the pilot-star of Love.
—With robe outspread the wavering flame behind
She kneels, and guards it from the shifting wind;
Breathes to her Goddess all her vows, and guides
Her bold Leander o'er the dusky tides;
Wrings his wet hair, his briny bosom warms,
And clasps her panting lover in her arms.

Deep, in wide caverns and their shadowy ailes,
Daughter of Earth, the chaste Truffelia smiles;
On silvery beds, of soft albeustus wove,
Meets her Gnome-husband, and avows her love.
—High o'er her couch impending diamonds blaze,
And branching gold the crystal roof inlays;
With verdant light the modest emeralds glow,
Blue sapphires glare, and rubies blush, below;
Light piers of lazuli the dome surround,
And pictured mochoes tessellate the ground;
In glittering threads along reflective walls
The warm rill murmuring twinkles, as it falls;
Now sink the Eolian strings, and now they swell,
And Echoes woo in every vaulted cell;
While on white wings delighted Cupids play,
Shake their bright lamps, and shed celestial day.

Truffelia. I. 392. (Lycoperdon Tuber) Truffle. Clandestine marriage. This fungus never appears above ground, requiring little air, and perhaps no light. It is found by dogs or swine, who hunt it by the smell. Other plants, which have no buds or branches on their stems, as the grasses, shoot out numerous stoles or scions underground; and this the more, as their tops or herbs are eaten by cattle, and thus preserve themselves.
Closed in an azure fig by fairy spells,
Bosom'd in down, fair Capri-Fica dwells;——

*Caprifacus* l. 408. Wild fig. The fruit of the fig is not a seed-vessel, but a receptacle inclosing the flower within it. As these trees bear some male and others female flowers, immersed on all sides by the fruit, the manner of their fecundation was very unintelligible, till Tournefort and Pontedera discovered, that a kind of gnat produced in the male figs carried the fecundating dust on its wings, (Cynips Pucens Syll. Nat. 919.) and, penetrating the female fig, thus impregnated the flowers; for the evidence of this wonderful fact, see the word Caprification, in Milne's Botanical Dictionary. The figs of this country are all female, and their seeds not prolific; and therefore they can only be propagated by layers and suckers.

Monseur de la Hire has shewn in the Memoir, de l'Academ. de Science, that the summer figs of Paris, in Provence, Italy, and Malta, have all perfect lamina, and ripen not only their fruits, but their seed; from which seed other fig-trees are raised; but that the lamina of the autumnal figs are abortive, perhaps owing to the want of due warmth. Mr. Milne, in his Botanic Dictionary (art. Caprification), says, that the cultivated fig-trees have a few male flowers placed above the female within the same covering or receptacle; which in warmer climates perform their proper office, but in colder ones become abortive. And Linneas observes, that some figs have the navel of the receptacle open; which was one reason that induced him to remove this plant from the clas Clandestine Marriage to the clas Polygamy. Lin. Spec. Plant.

From all these circumstances I should conjecture, that those female fig-flowers, which are closed on all sides in the fruit or receptacle without any male ones, are monsters, which have been propagated for their fruit, like barberries, and grapes without seeds in them; and that the Caprification is either an ancient process of imaginary use, and blindly followed in some countries, or that it may contribute to ripen the fig by decreasing its vigour, like cutting off a circle of the bark from the branch of a pear-tree. Tournefort seems inclined to this opinion; who says, that the figs in Provence and at Paris ripen sooner, if their buds be pricked with a straw dipped in olive-oil. Plums and pears punctured by some insects ripen sooner, and the part round the puncture is sweeter. Is not the honey-dew produced by the puncture of insects? will not wounding the branch of a pear-tree, which is too vigorous, prevent the blossom from falling off; as from some fig-trees the fruit is said to fall off unless they are wounded by caprification? I had last spring six young
So sleep in silence the Curculio, shut
In the dark chambers of the cavern'd nut,
Erodes with ivory beak the vaulted shell,
And quits on filmy wings its narrow cell.
So the please'd Linnet in the moss-wove nest,
Waked into life beneath its parent's breast,
Chirps in the gaping shell, bursts forth ere long,
Shakes its new plumes, and tries its tender song.—
—-And now the talisman she strikes, that charms
Her husband-Sylph,—and calls him to her arms.—
Quick, the light Gnat her airy Lord bestrides,
With cobweb reins the flying courier guides
From crystal steeps of viewless ether springs,
Cleaves the soft air on still expanded wings;
Darts like a sunbeam o'er the boundless wave,
And seeks the beauty in her secret cave.
So with quick impulse through all nature's frame
Shoots the electric air its subtile flame.
So turns the impatient needle to the pole,
Tho' mountains rise between, and oceans roll.

Where round the Orcades white torrents roar,
Scooping with ceaseless rage the incumbent shore,
Wide o'er the deep a dusky cavern bends
Its marble arms, and high in air impends;
Basaltic piers the ponderous roof sustain,
And steep their masy sandals in the main;
trees of the Ithia fig with fruit on them in pots in a stove; on removing them into larger boxes, they protruded very vigorous shoots, and the figs all fell off; which I ascribed to the increased vigour of the plant.

*Basaltic piers.* l. 433. This description alludes to the cave of Fingal in the island of Staffa. The basaltic columns, which compose the Giants
Round the dim walls, and through the whispering ailes, hoarse breathes the wind, the glittering water boils. Here the charm'd byssus with his blooming bride spreads his green sails, and braves the foaming tide; The star of Venus gilds the twilight wave, And lights her votaries to the secret cave; Light Cupids flutter round the nuptial bed, And each coy sea-maid hides her blushing head.

Where cool'd by rills, and curtain'd round by woods, Slopes the green dell to meet the briny floods, The sparkling noon-beams, trembling on the tide, The proteus-lover woos his playful bride,

Caufeway on the coast of Ireland, as well as those which support the cave of Fingal, are evidently of volcanic origin, as is well illustrated in an ingenious paper of Mr. Keir, in the Philof. Trans. who observed in the glafs, which had been long in a fusing heat at the bottom of the pots in the glafs-houses at Stourbridge, that crystals were produced of a form similar to the parts of the basaltic columns of the Giants Caufe-way.

Byssus. 437. Clandeſtine Marriage. It floats on the sea in the day, and sinks a little during the night; it is found in caverns on the northern shores, of a pale green colour, and as thin as paper.

The proteus-lover. I. 446. Conferva polymorpha. This vegetable is put amongst the cryptogamia, or clandestine marriages, by Linneus; but, according to Mr. Ellis, the males and females are on different plants. Philof. Trans. Vol. LVII. It twice changes its colour, from red to brown, and then to black; and changes its form by losing its lower leaves, and elongating some of the upper ones, so as to be mislaid by the unskilful for different plants. It grows on the shores of this country.

There is another plant, Medicago polymorpha, which may be said to assume a great variety of shapes; as the feed-veffels refeemble sometimes snail-horns, at other times caterpillars with or without long hair upon them; by which means it is probable they sometimes elude the depre-
To win the fair he tries a thousand forms,
Balks on the sands, or gambols in the storms.
A Dolphin now, his scaly sides he laves,
And bears the sportive damsel on the waves;
She strikes the cymbal as he moves along,
And wondering Ocean listen'd to the song.
—And now a spotted Pard the lover talks,
Plays round her steps, and guards her favour'd walks;
As with white teeth he prints her hand, careless,
And lays his velvet paw upon her breast,
O'er his round face her snowy fingers strain
The filken knots, and fit the ribbon-rein.
—And now a Swan, he spreads his plumy tails,
And proudly glides before the fanning gales;
Pleas'd on the flowery brink with graceful hand
She waves her floating lover to the land;
Bright shines his sinuous neck, with crimson beak
He prints fond kisses on her glowing cheek,
Spreads his broad wings, clates his ebon crest,
And claps the beauty to his downy breast.

A hundred virgins join a hundred swains,
And fond Adonis leads the sprightly trains;

...
Pair after pair, along his sacred groves
To Hymen's fane the bright procession moves;
Each smiling youth a myrtle garland shades,
And wreaths of roses veil the blushing maids;
Light joys on twinkling feet attend the throng,
Weave the gay dance, or raise the frolic song;
—Thick, as they pass, exulting Cupids fling
Promiscuous arrows from the sounding string;
On wings of gossamer soft whispers fly,
And the fly glance steals side-long from the eye.
—As round his shrine the gaudy circles bow,
And seal with muttering lips the faithless vow,
Licentious Hymen joins their mingled hands,
And loosely twines the meretricious bands,—
Thus where pleased Venus, in the southern main,
Sheds all her smiles on Otaheite's plain,
Wide o'er the isle her silken net she draws,
And the Loves laugh at all but Nature's laws."

Here ceased the Goddess,—o'er the silent strings
Applauding Zephyrs swept their fluttering wings;
Enraptured Sylphs arose in murmuring crowds
To air-wove canopies and pillowy clouds;

cause each has leaves or lungs appropriated to it; and the bark of the tree is only a congeries of the roots of all these individual buds. Thus hollow oak-trees and willows are often seen with the whole wood decayed and gone; and yet the few remaining branches flourish with vigour; but in respect to the male and female parts of a flower, they do not destroy its individuality any more than the number of paps of a sow, or the number of her cotyledons, each of which includes one of her young.
The society, called the Areoi, in the island of Otaheite, consists of about 100 males and 100 females, who form one promiscuous marriage.
Each Gnome reluctant fought his earthy cell,
And each bright Floret clos’d her velvet bell.
Then, on soft tiptoe, NIGHT approaching near
Hung o’er the tuneless lyre his fable ear;
Gem’d with bright stars the still ethereal plain,
And bade his Nightingales repeat the strain.
Description of the Poison-Tree in the Island of Java.
Translated from the original Dutch of N. P. Foerstch.

THIS destructive tree is called in the Malayan language Bohon-Upas, and has been described by naturalists; but their accounts have been so tinctured with the marvellous, that the whole narration has been supposed to be an ingenious fiction by the generality of readers. Nor is this in the least degree surprising when the circumstances which we shall faithfully relate in this description are considered.

I must acknowledge, that I long doubted the existence of this tree, until a stricter enquiry convinced me of my error. I shall now only relate simple unadorned facts, of which I have been an eye-witness. My readers may depend upon the fidelity of this account. In the year 1774 I was stationed at Batavia, as a surgeon, in the service of the Dutch East-India Company. During my residence there I received several different accounts of the Bohon Upas, and the violent effects of its poison. They all then seemed incredible to me, but raised my curiosity in so high a degree, that I resolved to investigate this subject thoroughly, and to trust only to my own observations. In consequence of this resolution, I applied to the Governor-General, Mr. Petrus Albertus van der Parra, for a pass to travel through the country: my request was granted; and, having procured every information, I set out on my expedition. I had procured a recommendation from an old Malayan priest, to another priest, who lives on
the nearest inhabitable spot to the tree, which is about fifteen or sixteen miles distant. The letter proved of great service to me in my undertaking, as that priest is appointed by the Emperor to reside there, in order to prepare for eternity the souls of those who for different crimes are sentenced to approach the tree, and to procure the poison.

The Bohon-Upas is situated in the island of Java, about twenty-seven leagues from Batavia, fourteen from Soura Charta, the seat of the Emperor, and between eighteen and twenty leagues from Tinkjo, the present residence of the Sultan of Java. It is surrounded on all sides by a circle of high hills and mountains; and the country round it, to the distance of ten or twelve miles from the tree, is entirely barren. Not a tree, nor a shrub, nor even the least plant or grass is to be seen. I have made the tour all around this dangerous spot, at about eighteen miles distant from the centre, and I found the aspect of the country on all sides equally dreary. The easiest ascent of the hills is from that part where the old ecclesiastic dwells. From his house the criminals are sent for the poison, into which the points of all warlike instruments are dipped. It is of high value, and produces a considerable revenue to the Emperor.

Account of the Manner in which the Poison is procured.

The poison which is procured from this tree is a gum that issues out between the bark and the tree itself, like the camphor. Malefactors, who for their crimes are sentenced to die, are the only persons who fetch the poison; and this is the only chance they have of saving their
lives. After sentence is pronounced upon them by the judge, they are asked in court, whether they will die by the hands of the executioner, or whether they will go to the Upas tree for a box of poison? They commonly prefer the latter proposal, as there is not only some chance of preserving their lives, but also a certainty, in case of their safe return, that a provision will be made for them in future by the Emperor. They are also permitted to ask a favour from the Emperor, which is generally of a trifling nature, and commonly granted. They are then provided with a silver or tortoiseshell box, in which they are to put the poisonous gum, and are properly instructed how to proceed while they are upon their dangerous expedition. Among other particulars, they are always told to attend to the direction of the winds; as they are to go towards the tree before the wind, so that the effluvia from the tree are always blown from them. They are told, likewise, to travel with the utmost dispatch, as that is the only method of insuring a safe return. They are afterwards sent to the house of the old priest, to which place they are commonly attended by their friends and relations. Here they generally remain some days, in expectation of a favourable breeze. During that time the ecclesiastic prepares them for their future fate by prayers and admonitions.

When the hour of their departure arrives, the priest puts on them a long leather-cap, with two glasses before their eyes, which comes down as far as their breast, and also provides them with a pair of leather-gloves. They are then conducted by the priest, and their friends and relations, about two miles on their journey. Here the priest repeats his instructions, and tells them where they are to look for the tree. He shows them a hill, which
they are told to ascend, and that on the other side they will find a rivulet, which they are to follow, and which will conduct them directly to the Upas. They now take leave of each other; and, amidst prayers for their success, the delinquents hasten away.

The worthy old ecclesiastic has assured me, that during his residence there, for upwards of thirty years, he had dismissed above seven hundred criminals in the manner which I have described; and that scarcely two out of twenty have returned. He shewed me a catalogue of all the unhappy sufferers, with the date of their departure from his house annexed; and a list of the offences for which they had been condemned: to which was added, a list of those who had returned in safety. I afterwards saw another list of these culprits, at the jail-keeper's at Souri-Charta, and found that they perfectly corresponded with each other, and with the different informations which I afterwards obtained.

I was present at some of these melancholy ceremonies, and desired different delinquents to bring with them some pieces of the wood, or a small branch, or some leaves of this wonderful tree. I have also given them silk cords, desiring them to measure its thickness. I never could procure more than two dry leaves that were picked up by one of them on his return; and all I could learn from him, concerning the tree itself, was, that it stood on the border of a rivulet, as described by the old priest; that it was of a middling size; that five or six young trees of the same kind stood close by it; but that no other shrub or plant could be seen near it; and that the ground was of a brownish sand, full of stones, almost impracticable for travelling, and covered with dead bodies. After many conversations with the old Malayan priest, I questioned
him about the first discovery, and asked his opinion of this dangerous tree; upon which he gave me the following answer:

"We are told in our new Alcoran, that, above an hundred years ago, the country around the tree was inhabited by a people strongly addicted to the sins of Sodom and Gomorrha; when the great Prophet Mahomet determined not to suffer them to lead such detestable lives any longer, he applied to God to punish them: upon which God caused this tree to grow out of the earth, which destroyed them all, and rendered the country for ever uninhabitable."

Such was the Malayan opinion. I shall not attempt to comment; but must observe, that all the Malayans consider this tree as an holy instrument of the great prophet to punish the sins of mankind; and, therefore, to die of the poison of the Upas is generally considered among them as an honourable death. For that reason I also observed, that the delinquents, who were going to the tree, were generally dressed in their best apparel.

This however is certain, though it may appear incredible, that from fifteen to eighteen miles round this tree, not only no human creature can exist, but that, in that space of ground, no living animal of any kind has ever been discovered. I have also been assured by several persons of veracity, that there are no fish in the waters, nor has any rat, mouse, or any other vermin, been seen there; and when any birds fly so near this tree that the effluvia reaches them, they fall a sacrifice to the effects of the poison. This circumstance has been ascertained by different delinquents, who, in their return, have seen the birds drop down, and have picked them up dead, and brought them to the old ecclesiastic.
I will here mention an instance, which proves them a
fact beyond all doubt, and which happened during my stay
at Java.

In the year 1775, a rebellion broke out among the sub-
jects of the Maflay, a sovereign prince, whose dignity is
nearly equal to that of the Emperor. They refused to
pay a duty imposed upon them by their sovereign, whom
they openly opposed. The Maflay sent a body of a thou-
sand troops to disperse the rebels, and to drive them, with
their families, out of his dominions. Thus four hundred
families, consisting of about sixteen hundred souls, were
obliged to leave their native country. Neither the Em-
peror nor the Sultan would give them protection, not only
because they were rebels, but also through fear of dis-
pleasing their neighbour, the Maflay. In this distressful
situation, they had no other resource than to repair to the
uncultivated parts round the Upas, and requested permis-
sion of the Emperor to settle there. Their request was
granted, on condition of their fixing their abode not more
than twelve or fourteen miles from the tree, in order not
to deprive the inhabitants already settled there at a greater
distance of their cultivated lands. With this they were
obliged to comply; but the consequence was, that in less
than two months their number was reduced to about three
hundred. The chiefs of those who remained returned to
the Maflay, informed him of their losses, and intreated his
pardon, which induced him to receive them again as sub-
jects, thinking them sufficiently punished for their miscon-
duct. I have seen and conversed with several of those who
survived soon after their return. They all had the ap-
pearance of persons tainted with an infectious disorder;
they looked pale and weak, and from the account which
they gave of the loss of their comrades, of the symptoms.
and circumstances which attended their dissolution, such as convulsions, and other signs of a violent death, I was fully convinced that they fell victims to the poison.

This violent effect of the poison at so great a distance from the tree, certainly appears surprising, and almost incredible; and especially when we consider that it is possible for delinquents who approach the tree to return alive. My wonder, however, in a great measure, ceased, after I had made the following observations:

I have said before, that malefactors are instructed to go to the tree with the wind, and to return against the wind. When the wind continues to blow from the same quarter while the delinquent travels thirty, or six and thirty miles, if he be of a good constitution, he certainly survives. But what proves the most destructive is, that there is no dependence on the wind in that part of the world for any length of time.—There are no regular land-winds; and the sea-wind is not perceived there at all, the situation of the trees being at too great a distance, and surrounded by high mountains and uncultivated forests. Besides, the wind there never blows a fresh regular gale, but is commonly merely a current of light, soft breezes, which pass through the different openings of the adjoining mountains. It is also frequently difficult to determine from what part of the globe the wind really comes, as it is divided by various obstructions in its passage, which easily change the direction of the wind, and often totally destroy its effects.

I, therefore, impute the distant effects of the poison, in a great measure, to the constant gentle winds in those parts, which have not power enough to disperse the poisonous particles. If high winds were more frequent and durable there, they would certainly weaken very much, and even destroy the obnoxious effluvia of the poison;
but without them, the air remains infected and pregnant with these poisonous vapours.

I am the more convinced of this, as the worthy ecclesiastic assured me, that a dead calm is always attended with the greatest danger, as there is a continual perspiration issuing from the tree, which is seen to rise and spread in the air, like the putrid steam of a marshy cavern.

*Experiments made with the Gum of the Upas-Tree.*

IN the year 1776, in the month of February, I was present at the execution of thirteen of the Emperor's concubines, at Soura-Charta, who were convicted of infidelity to the Emperor's bed. It was in the forenoon, about eleven o'clock, when the fair criminals were led into an open space within the walls of the Emperor's palace. There the judge passed sentence upon them, by which they were doomed to suffer death by a lancet poisoned with Upas. After this the Alcoran was presented to them, and they were, according to the law of their great prophet Mahomet, to acknowledge and to affirm by oath, that the charges brought against them, together with the sentence and their punishment, were fair and equitable. This they did, by laying their right hand upon the Alcoran, their left hands upon their breast, and their eyes lifted towards heaven; the judge then held the Alcoran to their lips, and they kissed it.

These ceremonies over, the executioner proceeded on his business in the following manner:—Thirteen posts, each about five feet high, had been previously erected. To these the delinquents were fastened, and their breasts stripped naked. In this situation they remained a short
time in continual prayers, attended by several priests, until a signal was given by the judge to the executioner; on which the latter produced an instrument, much like the spring lancet used by farriers for bleeding horses. With this instrument, it being poisoned with the gum of the Upas, the unhappy wretches were lanced in the middle of their breasts, and the operation was performed upon them all in less than two minutes.

My astonishment was raised to the highest degree, when I beheld the sudden effects of that poison, for in about five minutes after they were lanced, they were taken with a tremor, attended with a subfultus tendinum, after which they died in the greatest agonies, crying out to God and Mahomet for mercy. In sixteen minutes by the watch, which I held in my hand, all the criminals were no more. Some hours after their death, I observed their bodies full of livid spots, much like those of the Petechia, their faces swelled, their colour changed to a kind of blue, their eyes looked yellow, &c. &c.

About a fortnight after this, I had an opportunity of seeing such another execution at Samarang. Seven Malayans were executed there with the same instrument, and in the same manner; and I found the operation of the poison, and the spots in their bodies exactly the same.

These circumstances made me desirous to try an experiment with some animals, in order to be convinced of the real effects of this poison; and as I had then two young puppies, I thought them the fittest objects for my purpose. I accordingly procured with great difficulty some grains of Upas. I dissolved half a grain of that gum in a small quantity of arrack, and dipped a lancet into it. With this poisoned instrument I made an incision in the lower
muscular part of the belly in one of the puppies. Three minutes after it received the wound the animal began to cry out most piteously, and ran as fast as possible from one corner of the room to the other. So it continued during six minutes, when all its strength being exhausted, it fell upon the ground, was taken with convulsions, and died in the eleventh minute. I repeated this experiment with two other puppies, with a cat, and a fowl, and found the operation of the poison in all of them the same: none of these animals survived above thirteen minutes.

I thought it necessary to try also the effect of the poison given inwardly, which I did in the following manner. I dissolved a quarter of a grain of the gum in half an ounce of arrack, and made a dog of seven months old drink it. In seven minutes a retching ensued, and I observed, at the same time, that the animal was delirious, as it ran up and down the room, fell on the ground, and tumbled about; then it rose again, cried out very loud, and in about half an hour after was seized with convulsions, and died. I opened the body, and found the stomach very much inflamed, as the intestines were in some parts, but not so much as the stomach. There was a small quantity of coagulated blood in the stomach; but I could discover no orifice from which it could have issued; and therefore supposed it to have been squeezed out of the lungs, by the animal’s straining while it was vomiting.

From these experiments I have been convinced that the gum of the Upas is the most dangerous and most violent of all vegetable poisons; and I am apt to believe that it greatly contributes to the unhealthiness of that island. Nor is this the only evil attending it: hundreds
of the natives of Java, as well as Europeans, are yearly destroyed and treacherously murdered by that poison, either internally or externally. Every man of quality or fashion has his dagger or other arms poisoned with it; and in times of war the Malayans poison the springs and other waters with it; by this treacherous practice the Dutch suffered greatly during the last war, as it occasioned the loss of half their army. For this reason, they have ever since kept fish in the springs of which they drink the water; and sentinels are placed near them, who inspect the waters every hour, to see whether the fish are alive. If they march with an army or body of troops into an enemy's country, they always carry live fish with them, which they throw into the water some hours before they venture to drink it; by which means they have been able to prevent their total destruction.

This account, I flatter myself, will satisfy the curiosity of my readers, and the few facts which I have related will be considered as a certain proof of the existence of this pernicious tree, and its penetrating effects.

If it be asked why we have not yet any more satisfactory accounts of this tree, I can only answer, that the object of most travellers to that part of the world consists more in commercial pursuits than in the study of Natural History and the advancement of Sciences. Besides, Java is so universally reputed an unhealthy island, that rich travellers seldom make any long stay in it; and others want money, and generally are too ignorant of the language to travel, in order to make enquiries. In future, those who visit this island will probably now be induced to make it an object of their researches, and will furnish us with a fuller description of this tree.
I will therefore only add, that there exists also a sort of Cajoe-Upas on the coast of Macassar, the poison of which operates nearly in the same manner, but is not half so violent or malignant as that of Java, and of which I shall likewise give a more circumstantial account in a description of that island.—*London Magazine*.

SEEDS of Canna used for prayer-beads
Stems and leaves of Callistrichae so matted together, as they float on the water, as to bear a person walking on them
The female in Collinsonia approaches first to one of the males, and then to the other
Females in Nigella and Epilobium bend towards the males for some days, and then leave them
The stigma or head of the female in Sparrhiicum (common broom) is produced amongst the highest set of males; but when the keel-leaf opens, the pistil suddenly twiffs round like a French-born, and places the stigma amidst the lower set of males
The two lower males in Ballota become mature before the two higher; and, when their dust is shed, turn outwards from the female
The plants of the class Two Powers with naked seeds are all aromatic
Of thefe Marum and Nepeta are delightful to cats
The filaments in Meadie, Berago, Cyclamen, Solanum, &c. shewn by reafoning to be the most unchangeable parts of those flowers
Rudiments of two hinder wings are seen in the class Diptera, or two-winged insects
Tents of male animals
Filaments without anthers in Coreuma, Linum, &c. and styles without stigmas in many places, show the advance of the works of nature towards greater perfection
Double flowers, or vegetable monsters, how produced
The calyx and lower series of petals not changed in double flowers
Dispersion of the dust in nettles and other plants
Cedar and Cypreas unperifhable
Anthocyaninm gives the fragrant scent to hay
Viviparous plants: the Aphis is viviparous in summer, and viviparous in autumn
Irivatingly of the stamens of the plants of the class Syngenia, or Confederate males
Some of the males by Lychnis, and other flowers arrive sooner at their maturity
Males approach the female in Gloriosa, Fritillaria, and Raphia
Contrivances to destroy insects in Silene, Dionxaz muscipula, Arum muscivorum, Dryas, &c.
Some bell-flowers close at night; others hang the mouths downwards; others nod and turn from the wind; flammes bound down to the pitif in Amaryllis formosissima; pitif is crooked in Hemerocallis fava, yellow day-lily

14

Thorns and prickles designed for the defence of the plants; tall Hollies have no prickles above the reach of cattle

16

Bird-lime from the bark of Hollies like elatic gum

16

Adanfonia the largest tree known, its dimenions

17

Bulbous roots contain the embryon flower, seen by dissecting a tulip-root

18

Flowers of Colchicum and Ha-mamellis appear in autumn, and ripen their seed in the spring following

19

Sunflower turns to the sun by mutation, not by gyration

20

Dispersion of seeds

20

Drofera catches flies

21

Of the nectary, its finiture to preserve the honey from insects

22

Curious proboscis of the Sphinx Convoluli

22

Final cause of the resemblance of some flowers to insects, as the Bee-orchis

22

In some plants of the class Tetradyinia, or Four Powers, the two shorter flammes when at maturity, rise as high as the others

23

Ice in the caves on Teneriff, which were formerly hollowed by volcanic fires

23

Some parasites do not injure trees, as Tillandfia and Epidendrum

23

Moffes growing on trees injure them

24

Marriages of plants necessary to be celebrated in the air

24

Insects with legs on their backs

24

Scarcity of grain in wet seasons

24

Tartanian lamb; use of down on vegetables; air, glafs, wax, and fat, are bad conductors of heat; snow does not moisten the living animals buried in it, illuftrated by burning camphor in snow

25

Of the collapse of the fensitive plant

27

Birds of pallage

28

The acquired habits of plants

28

Irritability of plants increased by previous exposure to cold

29

Lichen produces the first vegetation on rocks

30

Plants holding water

31

Madder colours the bones of young animals

31

Colours of animals serve to conceal them

32

Warm bathing retards old age

32

Male flowers of Valfneria detach themselves from the plant, and float to the female ones

33

Air in the cells of plants, its various uifes

34

How Mr. Day probably lost his life in his diving-ship

35

Air bladers of fish

35

Star-gelly is avoided by Herons

36

Intoxicating mufhrooms

36

Mufhrooms grow without light, and approach to animal nature

37

Seeds of Tillandfia fly on long threads, like spiders on the gofferm

37

Account of cotton mills

52

Invention of letters, figures, crotchets

53

Mrs. Delany’s and Mrs. North’s paper-gardens

56

The horologe of Flora

56

The white petals of Helleborus niger becomes fift red, and then change into a green calyx

58

Berries of Menispernum intoxic-icate fish

60

Effects of opium

61

Frontifpiece by Mrs Crew

62

Petals of Ciftus and Oenanthe continue but a few hours

63

Method of collecting the gum from Ciftus by leathern thongs
Discovery of the Bark 65
Foxglove how used in Dropies 68
Bishop of Marfelles, and Lord Mayor of London 68
Superfluous uses of plants, the divining rod, animal magnetism 76
Intoxication of the Pythian Priests, poison from Laurel-leaves, and from cherry-kernels 78
Sleep consists in the abolition of voluntary power; nightmare explained 80
Indian fig emits slender cords from its summit 81
Cave of Thor in Derbyshire, and subterraneous rivers explained 81
The capsule of the Geranium makes a hygrometer; Barley creeps out of a barn 83
Mr. Edgeworth's creeping hygrometer 84
Flower of Fraxinella flashes on the approach of a candle 85
Essential oils narcotic, poisonous, deleterious to insects 86
Dew-drops from Manchinella blister the skin 86
Uses of poisonous juices in the vegetable economy 87
The fragrance of plants a part of their defence 87
The flinging and poison of a nettle 87
Vapour from Lobelia suffocative; unwholesome effects of perfumed hair-powder 87
Ruins of Ephedra 88
The poison-tree of Java 89, 149
Tulip roots die annually 91
Hyacinth and Ranunculus roots 91
Vegetable converse for air and light 94
Some volatile items turn F. S. W. and others W. S. E. 94
Top of white Bryony as grateful as asparagus 95
Fermentation converts sugar into spirit, food into poison 96
Fable of Prometheus applied to dram-drinkers 97
Cyclamen buries its seeds and trifolium subterraneum 97
Pits dug to receive the dead in the plague 99
Lakes of America consist of fresh water 99
The seeds of Caffia and some others are carried from America, and thrown on the coasts of Norway and Scotland 99
Of the gulph stream 100
Wonderful change predicted in the gulph of Mexico 101
In the flowers of Cactus grandiflorus and Cithus some of the stamens are perpetually bent to the pistil 118
Nyctanthes and others are only fragrant in the night; Cucurbita lagenaria closes when the sun shines on it 118
Tropaelum, naflurtion, emits sparks in the twilight 119
Nelcary on its calyx 120
Phosphorescent lights in the evening 120
Hot embers eaten by bull-frogs 121
Long filaments of grasses, the cause of bad feed-wheat 122
Chinese hemp grew in England above 14 feet in five months 124
Roots of snow-drop and hyacinth infested like orchis 126
Orchis will ripen its seeds if the new bulb be cut off 126
Proliferous flowers 126
The wax on the candle-berry myrtle fast to be made by insects 127
The warm springs of Matlock produced by the condensation of steam raised from great depths by subterranean fires 128
Air separated from water by the attraction of points to water being less than that of that of the meteoric water to each other 129
Minute division of sub-aquatic leaves 130
Water-cresses and other aquatic plants inhabit all climates 130
Butomus efculent; Lotus of Egypt; Nymphea 131
Ocymum covered with salt every night 132
Salt a remote cause of scrophula, and immediate cause of sea-scurvy 132
Coloured spathe of Arum, and blotched leaves, if they serve the purpose of a coloured petal 135
Tulip-roots with a red cuticle produce red flowers 135
Of vegetable mules the internal parts, as those of fructification, resemble the female parent; and the external parts, the male one 136
The same occurs in animal mules, as the common mule and the hinny, and in sheep 136
The wind called Harmattan from volcanic eruptions; some epidemic coughs or influenza have the same origin 137
Fish killed in the sea by dry fummers in Asia 138
Hedyfarum gyranst perpetually moves its leaves like the respiration of animals 139
Plants possess a voluntary power of motion 139
Loud cracks from ice-mountains explained 140
Mufchus corallinus vegetates below the snow, where the heat is always about 40. 140
Quick growth of vegetables in northern latitudes after the solution of the snows explained 140
The Rail sleeps in the snow 140
Conferva agagropila rolls about the bottom of lakes 141
Lycoperdon tuber, truffle, requires no light 142
Account of capriflication 143
Figs wounded with a straw, and pears and plums wounded by insects ripen sooner, and become sweeter 143
Female figs cloiled on all sides, supposed to be monsters 143
Basaltic columns produced by volcanoes hewn by their form 144
Byfius floats on the sea in the day, and sinks in the night 145
Conferva polymorpha twice changes its colour and its form 145
Some feed vessels and feeds resemble insects 145
Individuality of flowers not destroyed by the number of males or females which they contain 146
Trees are swarms of buds, which are individuals 146
INDEX

OF THE

NAMES OF THE PLANTS.

| A DONIS | 146 | Conféva | 141, 145 |
| Ægragrópila | 141 | Cupréflis | 8 |
| Alcea | 7 | Curcúma | 5 |
| Amaryllis | 14 | Cufcúta | 94 |
| Anémone | 28 | Cyclamen | 97 |
| Anthoxánthum | 9 | Cypérus | 53 |
| Arum | 134 | Diánthus | 136 |
| Avéna | 122 | Diétámnus | 85 |
| Bárometz | 25 | Digitális | 68 |
| Bellis | 126 | Dodecátheon | 5 |
| Byflus | 145 | Drába | 23 |
| Cáctus | 118 | Drófera | 21 |
| Caléndula | 56 | Dypfacus | 31 |
| Callitriche | 3 | Cáncelas | 81 |
| Cánna | 3 | Chónis | 129 |
| Cánábis | 124 | Fraxínélia | 85 |
| Cápri-fícus | 143 | Galánthus | 135 |
| Carlina | 48 | Genítà | 4 |
| Caryophyllus | 136 | Gloriófo | 14 |
| Cáffia | 99 | Goffýpium | 52 |
| Céreus | 118 | Hedyfarum | 139 |
| Chondrilla | 10 | Helíánthus | 20 |
| Chunda | 139 | Helleborus | 58 |
| Cinchóna | 65 | Hippómane | 86 |
| Circza | 76 | Ilex | 16 |
| Ciflus | 63 | Impátiens | 83 |
| Cócculus | 60 | Iris | 9 |
| Cólichim | 19 | | |
| Collintónia | 3 | | |
Kleinhóvia 17  Papyrus 53
Láphana 56  Plantágo 9
Lráuro-cérasus 78  Polymórpha 145
Lícen 30  Polypodium 25
Lín 51  Prúms 78
Lobélla 87  Rúbia 31
Loncáléta 22  Siléne 13
Lychnis 21  Trápa 130
Lycoperdon 142  Tremélla 36
Mancínélla 86  Tropéchum 119
Média 9  Trulpélla 142
Melífa 4  Tulipa 18
Menístpérmuma 60  Ulva 34
Mínófa 27  Upas 89
Múshus 140  Utica 87
Nymphaza 56  Vallifnéri 33
Ocymum 132  Vifcum 23
Orchis 91  Vitis 96
Olmúnda 10  Zoftéra 24
Olyris 8
Papáver 61

DIRECTIONS TO THE BINDER.

The two prints of flowers in small compartments both facing the last page of the Preface.
[Darwin, Erasmus]

The botanic garden
